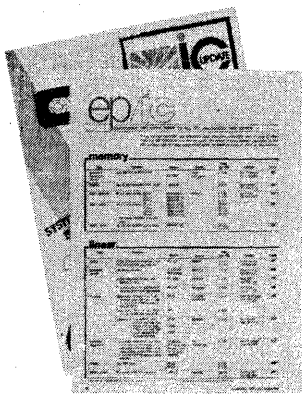
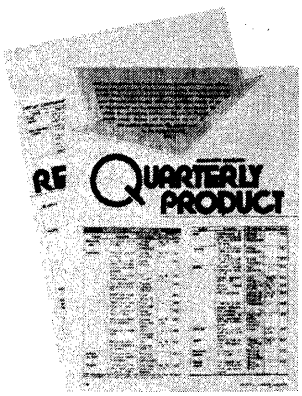
SUBSCRIBE TO ELECTRONIC PRODUCTS MAGAZINE. IT'S YOUR *COMPLETE* GUIDE TO EVERYTHING THAT'S NEW IN THE FAST-CHANGING WORLD OF ELECTRONIC PRODUCTS AND SYSTEMS.



FEATURE STORIES every month on electronic products, applications and availability.

FORUMS—Reports on meetings of manufacturers, users and distributors. Get the very latest news on a wide variety of products.

NEW PRODUCT NEWS—Hundreds of new products are introduced each month. You'll get the facts on not only what the new product is, but also where to get it, basic prices and current delivery.



EP/IC UPDATE—Exclusive in ELECTRONIC PRODUCTS. A monthly report on *everything* that's new in the fast-moving world of integrated circuits.

QUARTERLY PRODUCT REVIEW—Another exclusive in ELECTRONIC PRODUCTS. A complete report of *every* new electronic product introduced in the previous quarter. This feature is in the January, April, July and October issues.

QUARTERLY PRODUCT PLANNING DIRECTORY—A compilation of the latest catalogs of a wide variety of electronic products and systems.

OUTLOOK—Important industry news affecting electronic products and systems.

COMPONENT CAPERS—A humorous look at the strange and wonderful world of electronics.

MINI-GLOSSARIES, Quizzes and more—Each and every month for over twenty years the readers of ELECTRONIC PRODUCTS learn something new about the products they work with and specify.

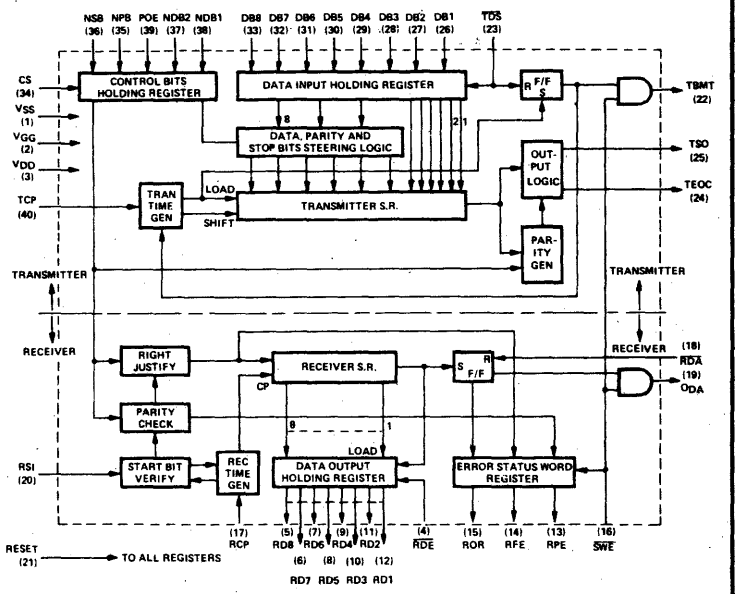
TCK-100 TouchControl™ Kit

The AMI TouchControl kit demonstrates the ease with which this unique system of capacitive switching may be implemented. Included in the kit are a printed circuit board and AMI's S9263 TouchControl circuit. The printed wiring board, which has sixteen touch switches etched into its top surface, contains on its reverse side all the interconnection necessary to interface the S9263 outputs with sixteen light emitting diodes. Additional components required for the kit are readily available, and assembly of the kit should take less than an hour's time.

The TouchControl™ Concept



TouchControl™ panels replace mechanical switches with non-moving electronically sensitive glass (or other material) panels that respond to the touch of a finger. The most apparent advantage of TouchControl is the visual appeal of a flat keyboard, which may be designed in a wide variety of patterns and colors. In addition to the advanced styling features, TouchControl also offers several practical benefits, such as the reliability of non-moving electronic controls and electrical isolation of the entire switch area. TouchControl also provides safety advantages, complete moisture proofing and ease of cleaning. Contact your nearest AMI Sales Office for additional information about the TouchControl concept.

Universal Asynchronous Receiver/Transmitter (UART)

S1883 BLOCK DIAGRAM

PIN/PACKAGE CONFIGURATION

FEATURES

- 12.5 K Baud Data Rates
- 5-8 Bit Word Length
- Parity Generation/Checking Odd, Even, None
- Framing and Overflow Error Detection
- 1, 1.5, or 2 Stop Bits
- Double Buffered Input/Output
- Independent Transmit/Receive Rates
- Start and Stop Bits Generated and Detected
- Interchangeable with TMS6011, COM2017, TR1602, AY-5-1013
- Tri-State Outputs

FUNCTIONAL DESCRIPTION

The S1883 Universal Asynchronous Receiver Transmitter (UART) is a single chip MOS/LSI device that totally replaces the asynchronous parallel to serial and serial to parallel conversion logic required to interface a word parallel controller or data terminal to a bit serial communication network.

For asynchronous data transmission with a non-contiguous data bit stream, the UART automatically inserts a START bit preceding each character and under program control 1, 1.5, or 2 stop bits at the end of each character. To detect incoming characters in a noisy environment the UART employs a START bit detection network and allows errorless recovery of data with up to 42% distortion.

The UART will transmit or receive data characters of 5, 6, 7, or 8 bit length. Options allow the generation and checking of odd, even parity or no parity. The odd or even parity bit is automatically added to the character length for transmission. The parity bit is removed, checked and an error flag set if incorrectly received.

The data or baud rate at the receiver input and transmitter output are determined independently by external clock inputs. The clock inputs must be 16 times the data rate required at the serial input and output. The independent clocks allow for either half or full duplex operation.

The UART provides a buffer register in both the transmitter and receiver to allow a full character time for responding to a received data ready or transmit data request signal. The UART generates a MARK signal if the transmit register is not loaded with a data character and also indicates an overflow error if two characters are received without a RDA input.

TYPICAL APPLICATIONS

- Computer Peripherals
- Communication Concentrators
- Integrated Modems
- Industrial Data Transmission
- TTY Terminals
- Time Division Multiplexing

ABSOLUTE MAXIMUM RATINGS

Ambient Temperature Under Bias	0°C to +70°C
Storage Temperature	−65°C to +150°C
Positive Voltage on Any Pin with Respect to V_{SS}	+.3 Volt
Negative Voltage on Any Pin with Respect to V_{SS}	−20.0 Volt

NOTE: Stresses greater than those listed as Maximum Ratings may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operation section of this specification are not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

TIMING WAVEFORMS (Figure 1)

PIN DEFINITIONS

Pin	Label	Function
(1)	V_{SS}	+5 Volt ± 5%
(2)	V_{GG}	−12 Volt ± 5%
(3)	V_{DD}	Ground
(21)	RESET	The transmitter status outputs TBMT and TEOC are set to V_{OH} indicating the input transmitter buffer register is empty. The TSO output generates V_{OH} or MARK until a valid data character has been loaded into the transmitter and valid data transmission begins. The receiver status output ODA, is reset to the V_{OL} state.
(38)	NDB1	Number Data Bits/Character
(37)	NDB2	Number Data Bits/Character
(36)	NSB	Number Stop Bits The bit length of each data character and the number of stop bits added to each transmitted character are defined by these three inputs. The character word length does not include the parity bit and is common to both the transmitter and receiver if operating in the full duplex mode.

NSB	NDB2	NDB1	BITS/CHARACTER	STOP BITS
V_{IL}	V_{IL}	V_{IL}	5	1
V_{IL}	V_{IL}	V_{IH}	6	1
V_{IL}	V_{IH}	V_{IL}	7	1
V_{IL}	V_{IH}	V_{IH}	8	1
V_{IH}	V_{IL}	V_{IL}	5	1.5
V_{IH}	V_{IL}	V_{IH}	6	2
V_{IH}	V_{IH}	V_{IL}	7	2
V_{IH}	V_{IH}	V_{IH}	8	2

(35)	NPB	NO PARITY BIT. A V_{IH} eliminates the PARITY bit from being transmitted causing the STOP bit(s) to immediately follow the last data bit. The receiver assumes the bit(s) following the last data bit to be STOP bits. The RPE output is also forced to a V_{OL} condition.
(39)	POE	PARITY ODD/EVEN. If the NPB input is V_{IL}, the parity mode is ODD if POE is V_{IL} and EVEN if POE is V_{IH}. The parity mode is the same for both the transmitter and receiver.
(34)	CS	CONTROL STROBE. A V_{IH} loads POE, NDB1, NDB2, NPB, NSB into the CONTROL HOLDING REGISTER. To load the control inputs for static operation CS can be hard-wired to V_{IH}.
(26)	DB1	TRANSMITTER DATA BITS. Input data on DB1-DB8 are strobed into the DATA INPUT
(27)	DB2	HOLDING REGISTER by $\overline{TDS}$.
(28)	DB3	Input data is assumed right justified so DB1 is always the least significant bit and is the bit
(29)	DB4	
(30)	DB5	

Pin	Label	Function
(31)	DB6	transmitted following the START bit. For data words less than eight bits, the unused bits are
(32)	DB7	don't care inputs.
(33)	DB8	
(23)	$\overline{TDS}$	TRANSMITTER DATA STROBE. A V_{IL} enters data on the DB1-DB8 inputs into the INPUT HOLDING REGISTER. If the transmitter is in the idle state with both TBMT and TEOC at V_{OH}, the START bit will be generated on the first negative transition of the input clock TCP following the return of $\overline{TDS}$ to a V_{IH} state.
(25)	TSO	TRANSMITTER SERIAL OUTPUT. Data entered on DB1-DB8 are serially transmitted on TSO. A START (SPACE) bit precedes each character. A PARITY bit, if selected, and the correct number of STOP bits follow the last valid data bit. The TSO output is V_{OH} (MARK) when a valid character is not being transmitted.
(22)	TBMT	TRANSMITTER BUFFER EMPTY. A V_{OH} indicates the character in the INPUT HOLDING REGISTER has been transferred into the transmitter and a new character may be loaded into the INPUT HOLDING REGISTER. One complete character time (START BIT, DATA BITS, PARITY BIT, AND STOP BIT(S)) is available to load the next character. If a $\overline{TDS}$ is not generated within the time allotted, the TSO output will go into an idle state of V_{OH} or a MARK condition. TBMT will remain in the tri state mode unless $\overline{SWE}$ is a U_{ZL}.
(24)	TEOC	TRANSMITTER END OF CHARACTER. A V_{OL} to V_{OH} transition indicates the transmission of the character and stop bits have been completed. The V_{OH} is maintained until the leading edge of the next START bit (MARK to SPACE transition) is generated.
(40)	TCP	TRANSMITTER CLOCK PULSE. The transmitter input clock must be 16 times faster than the desired baud rate at TSO.
(17)	RCP	RECEIVER CLOCK PULSE. The receiver input clock must be 16 times the baud rate of data received on RSI.
(20)	RSI	RECEIVER SERIAL INPUT. Serial input data is received on RSI at a baud rate 1/16th the rate of RCP. The V_{IH} to V_{IL} (MARK to SPACE) transition beginning each START bit synchronizes the receiver to the incoming data. Data is assumed to be received least significant bit first.
(12)	RD1	RECEIVER DATA. Data outputs from the DATA OUTPUT HOLDING REGISTER are
(11)	RD2	active only when $\overline{RDE}$ is a V_{IL}. The eight data outputs are in a tri-state mode if $\overline{RDE}$ is a
(10)	RD3	V_{IH}. Data is presented at the outputs right justified with RDI the least significant bit. For
(9)	RD4	data word lengths less than 8 bits the unused bits will appear as V_{OL}.
(8)	RD5	
(7)	RD6	
(6)	RD7	
(5)	RD8	
(4)	$\overline{RDE}$	RECEIVER DATA ENABLE. A V_{IL} enables data in the DATA OUTPUT HOLDING REGISTER to the RECEIVER DATA output pins. For an output configuration not requiring a tri-state condition for RD1-RD8 the RDE input can be tied directly to ground enabling the data outputs at all times.
(19)	ODA	OUTPUT DATA AVAILABLE. A V_{OH} indicates a complete character has been received and transferred to the DATA OUTPUT HOLDING REGISTER. The ODA output will be in the tri-state mode unless $\overline{SWE}$ is a V_{IL}. For contiguous data inputs on RSI data will remain in the holding register one character time before being lost.
(18)	$\overline{RDA}$	RESET DATA AVAILABLE. A V_{IL} resets the ODA to a V_{OL}. If ODA is not reset by $\overline{RDA}$ the ROR will be set when the next complete character is received and transferred to the DATA OUTPUT HOLDING REGISTER.
(15)	ROR	RECEIVER OVERRUN. A V_{OH} indicates a second character has been received and transferred to the DATA OUTPUT HOLDING REGISTER without an intervening $\overline{RDA}$. If the previously received character has not been unloaded from the register the next character will be loaded and the first character lost. ROR will remain in the tri-state mode unless $\overline{SWE}$ is a V_{IL}.
(14)	RFE	RECEIVER FRAMING ERROR. A V_{OH} indicates a correct STOP bit was not received following the START bit and correct number of data bits. RFE will remain in the tri-state mode unless $\overline{SWE}$ is a V_{IL}.

©IC MASTER 1979

Pin	Label	Function
(13)	RPE	RECEIVER PARITY ERROR. A V_{OH} indicates the accumulated parity on the received character does not compare with the parity mode set by POE. RPE will remain in the tri-state mode unless $\overline{SWE}$ is a V_{IL}.
(16)	$\overline{SWE}$	STATUS WORD ENABLE. A V_{IL} enables the status outputs ODA, ROR, RFE, RPE and TBMT on the respective output lines. When $\overline{SWE}$ is V_{IH} all status outputs are in the tri-state mode. For output configurations not requiring a tri-state condition for the status outputs, $\overline{SWE}$ may be tied directly to ground.

APPLICATION DATA

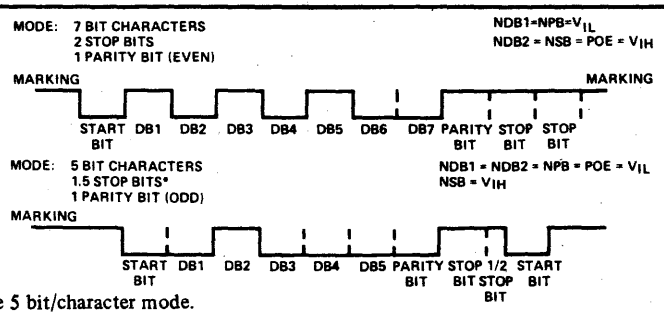
Asynchronous data communications is typified by low data rates, non-contiguous data messages, and a MARK condition on the line between characters. As a result, each data character must be framed for recognition by START and STOP bits. The S1883 UART provides all the logic required to provide a complete full-duplex (transmit and receive simultaneously) asynchronous communication channel for baud rates up to 9600 bps. Included in the S1883 capabilities are; automatic START and STOP bit generation and detection; PARITY generation and detection on variable length characters; tri-state outputs for data and status for data bus configurations, double buffering for less critical timing, and a receiver allowing acceptance of data with up to 42% distortion.

RECEIVER OPERATION

Asynchronous communication line discipline dictates that each character, regardless of width, must be preceded by a START bit. The receiver input logic detects the V_{IH} to V_{IL} (MARK to SPACE) transition on the RSI line that is the leading edge of the START bit. For one half bit time after the leading edge, RSI is sampled for a V_{IL} to insure a proper START bit was present. The following data bits are then clocked into the receiver in the center of each bit period. If RSI returns to the V_{IH} condition before the mid-point of the START bit, the receiver returns to a search for a MARK to SPACE transition.

If at the time of transfer ODA has not been reset by a $\overline{RDA}$, indicating the previous character has not been read, the ROR error flag is set to V_{OH}. The previous data character and status will be lost as the new character is loaded. One full character time is available, assuming contiguous data input at RSI, after ODA is set to read the output character. The data is available at the outputs RD1-RD8 right justified with RD1 the least significant bit. For character widths less than 8 bits the unused outputs are forced to V_{OL}.

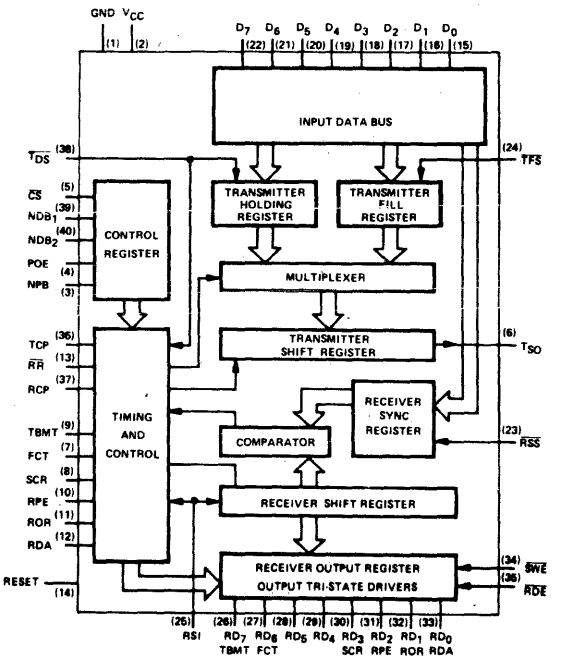
For data bus configurations the output data and status are tri-state lines enabled by $\overline{RDE}$ and $\overline{SWE}$ respectively. For polled systems $\overline{SWE}$ can be strobed for detection of ODA and error conditions prior to reading data. For interrupt driven systems $\overline{SWE}$ can be tied directly to ground and ODA used as a data ready interrupt input. A minimum of one character time is available to test the remaining error status bits and input the data character. Typically the same signal can be used for $\overline{RDE}$ and $\overline{RDA}$.



TRANSMITTER OPERATION

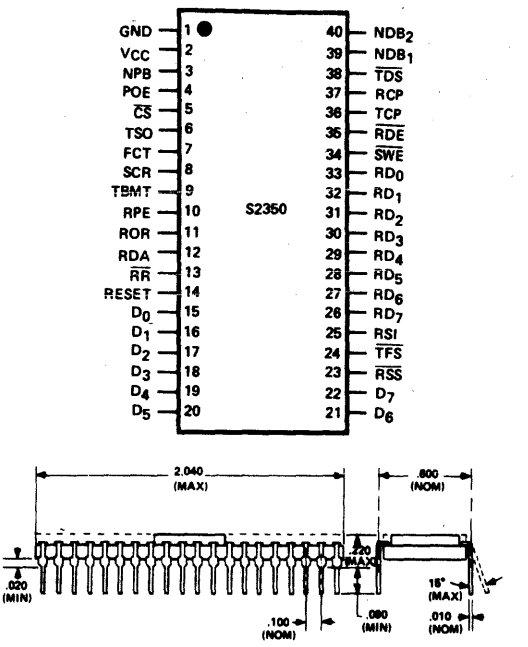
The transmit section of the S1883 is reset to a MARK condition with V_{OH} on TSO after receiving a pulse on RESET. Additionally, the transmitter is reset to a character request mode with TBMT and TEOC both at V_{OH}. If the character format is not static, the word length NDB1 and NDB2, parity mode NPB and POE, and number of stop bits NSB should be strobed into the UART with CS.

If both the DATA INPUT HOLDING REGISTER and the TRANSMITTER SHIFT REGISTER are empty the transmitter is in the idle state with TSO, TBMT and TEOC all at V_{OH}. The START bit for a data character loaded with a $\overline{TDS}$ pulse during the idle state is generated at the first negative transition of the TCP following the trailing edge of $\overline{TDS}$. TBMT goes to V_{OL} with the first $\overline{TDS}$. As soon as the character is transferred from the INPUT HOLDING REGISTER to the SHIFT REGISTER, TBMT returns to a V_{OH} and a second character can be loaded. Each character is transmitted with a START bit and 1, 1.5 or 2 stop bits controlled by the respective inputs.



The TEOC is set to V_{OH} after the generation of the last STOP bit indicating the complete character has been transmitted.

TYPICAL DATA FORMAT



*1.5 stop bits generated only in the 5 bit/character mode.

Universal Synchronous Receiver/Transmitter (USRT)

BLOCK DIAGRAM

PIN/PACKAGE CONFIGURATION

FEATURES

- 500 KHz Data Rates
- Internal Sync Detection
- Fill Character Register
- Double Buffered Input/Output
- Bus Oriented Outputs
- 5–8 Bit Characters
- Odd/Even or No Parity
- Error Status Flags
- Single Power Supply (+5v)
- Input/Output TTL Compatible

FUNCTIONAL DESCRIPTION

The S2350 Universal Synchronous Receiver Transmitter (USRT) is a single chip MOS/LSI device that totally replaces the serial to parallel and parallel to serial conversion logic required to interface a word parallel controller or data terminal to a bit-serial, synchronous communication network.

The USRT consists of separate receiver and transmitter sections with independent clocks, data lines and status. Common with the transmitter and receiver are word length and parity mode. Data is transmitted and received in a NRZ format at a rate equal to the respective input clock frequency.

Data messages are transmitted as a contiguous character stream, bit synchronous with respect to a clock and character synchronous with respect to framing or "sync" characters initializing each message. The USRT receiver compares the contents of the internal Receiver Sync Register with the incoming data stream in a bit transparent mode. When a compare is made, the receiver becomes character synchronous formatting a 5, 6, 7, or 8 bit character for output each character time. The receiver has an output buffer register allowing a full character time to transfer the data out. The receiver status outputs indicate received data available (RDA), receiver overrun (ROR), receive parity error (RPE) and sync character received (SCR). Status bits are available on individual output lines and can also be multiplexed onto the output data lines for bus organized systems. The data lines have tri-state outputs.

The USRT transmitter outputs 5, 6, 7, or 8 bit characters with correct parity at the transmitter serial output (TSO). The transmitter is buffered to allow a full character time to respond to a transmitter buffer empty (TBMT) request for data. Data is transmitted in a NRZ format changing on the positive transition of the transmitter clock (TCP). The character in the transmitter fill register is inserted into the data message if a data character is not loaded into the transmitter after a TBMT request.

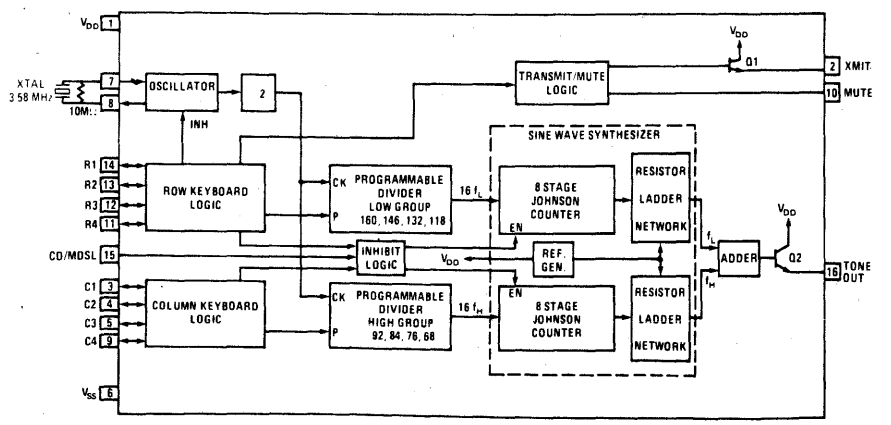
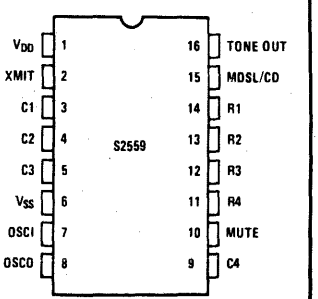
DIGITAL TONE GENERATOR



Features

- ☐ Wide Operating Supply Voltage Range: 3.5 to 13 Volts (A, B) 2.75 to 10 Volts (C, D)
- ☐ Low Power CMOS Circuitry Allows Device Power to be Derived Directly from the Telephone Lines or from Small Batteries, e.g., 9V.
- ☐ Uses TV Crystal Standard (3.58MHz to Derive all Frequencies thus Providing Very High Accuracy and Stability
- ☐ MUTE and Transmitter Drivers On Chip
- ☐ Interfaces Directly to a Standard Telephone Push-Button or Calculator Type X-Y Keyboard
- ☐ The Total Harmonic Distortion is Below Industry Specification
- ☐ On Chip Generation of a Reference Voltage to Assure Amplitude Stability of the Dual Tones Over the Operating Voltage and Temperature Range
- ☐ Dual Tone as well as Single Tone Capability
- ☐ Four Options Available:
  - A: 3.5 to 13V Mode Select
  - B: 3.5 to 13V Chip Disable
  - C: 2.75 to 10V Mode Select
  - D: 2.75 to 10V Chip Disable



General Description

The S2559 Digital Tone Generator is specifically designed to implement a dual tone telephone dialing system. The device can interface directly to a standard pushbutton telephone keyboard or calculator type X-Y keyboard and operates directly from the telephone lines. All necessary dual-tone frequencies are derived from the widely used TV crystal standard providing very high accuracy and stability. The required sinusoidal waveform for the individual tones is digitally synthesized on the chip. The waveform so generated has very low total harmonic distortion. A voltage reference is generated on the chip which is stable over the operating voltage and temperature range and regulates the signal levels of the dual tones to meet the recommended telephone industry specifications. These features permit the S2559 to be incorporated with a slight modification of the standard 500 type telephone basic circuitry to form a pushbutton dual-tone telephone. Other applications of the device include radio and mobile telephones, remote control, Point-of-Sale, and Credit Card Verification Terminals and process control.

KEY PULSER

February 1978

Features

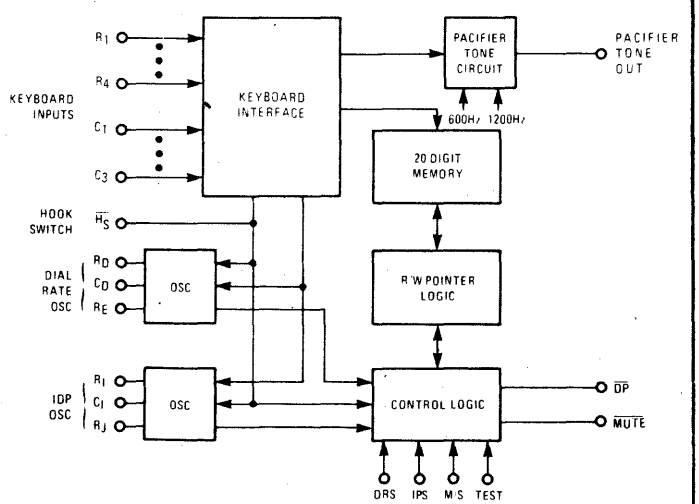
- ☐ Low Voltage CMOS Process for Direct Operation From Telephone Lines
- ☐ Inexpensive R-C Oscillator Design Provides Better than ±5% Accuracy Over Temperature and Unit to Unit Variations
- ☐ Dialing Rate Can Be Varied By Changing the Dial Rate Oscillator Frequency
- ☐ Dial Rate Select Input Allows Changing of the Dialing Rate by a 2:1 Factor Without the Need of Changing Oscillator Components
- ☐ Two Selections of Mark/Space Ratios (33-1/3 /66-2/3 or 40/60)
- ☐ Twenty Digit Memory for Input Buffering and for Redial With Access Pause Capability
- ☐ Mute and Dial Pulse Drivers on Chip
- ☐ Accepts Standard Telephone DPCT Keypad Arranged in a 2 of 7 Format; Also Capable of Logic Interface
- ☐ Ignores Multi Key Entries

General Description

The S2560 Key Pulser is a CMOS integrated circuit that converts pushbutton inputs to a series of pulses suitable for telephone dialing. It is intended as a replacement for the mechanical telephone dial and can operate directly from the telephone lines with minimum interface. Storage is provided for 20 digits, therefore, the last dialed number is available for redial until a new number is entered.

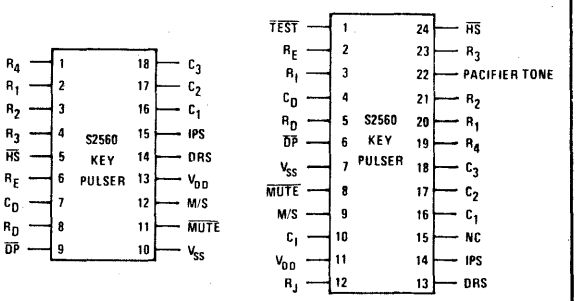
Unique Features of S2560A (18 Pin Package)

IDP scaled to the dialing rate such as to produce smaller IDP at higher dialing rates. Additionally, the IDP can be changed by a 2:1 factor at a given dialing rate by means of the IDP select input.



Unique Features of S2560B (24 Pin Package)

Separate IDP oscillator for selecting an IDP independent of the dialing rate. Provision for changing of the IDP by a 2:1 factor without the need of changing external components.



Alternating pacifier tone output simulates dual tone effects coincident with each keyboard number entry.

Data subject to change at any time without notice. These sheets transmitted for information only.

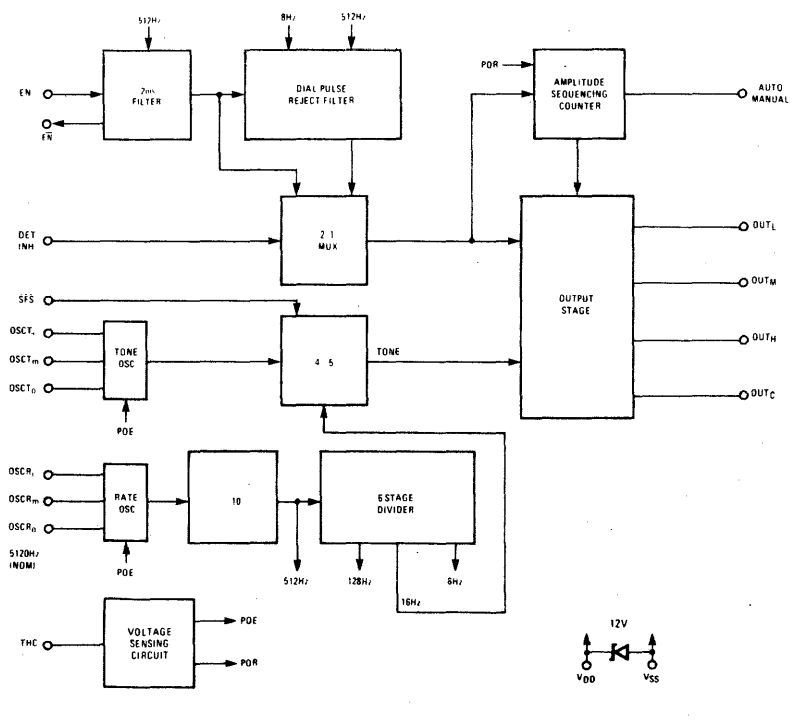
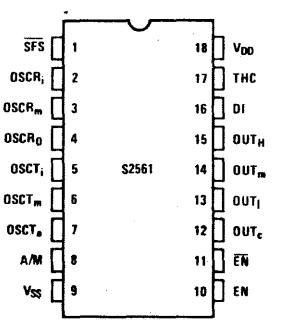
TONE RINGER

Features



- ☐ CMOS Process for Low Power Operation
- ☐ Operates Directly from Telephone Lines with Simple Interface
- ☐ Also Capable of Logic Interface for Non-Telephone Applications
- ☐ Provides a Tone Signal that Shifts Between Two Predetermined Frequencies at Approximately 16Hz to Closely Simulate the Effects of the Telephone Bell
- ☐ Push-Pull Output Stage Allows Direct Drive, Eliminating Capacitive Coupling and Provides Increased Power Output
- ☐ 50mW Output Drive Capability at 10V Operating Voltage
- ☐ Auto Mode Allows Amplitude Sequencing such that the Tone Amplitude Increases in Each of the First Three Rings and Thereafter Continues at the Maximum Level
- ☐ Single Frequency Tone Capability

General Description



The S2561 Tone Ringer is a CMOS integrated circuit that is intended as a replacement for the mechanical telephone bell. It can be powered directly from the telephone lines with minimum interface and can drive a speaker to produce sound effects closely simulating the telephone bell.

Data subject to change at any time without notice. These sheets transmitted for information only.

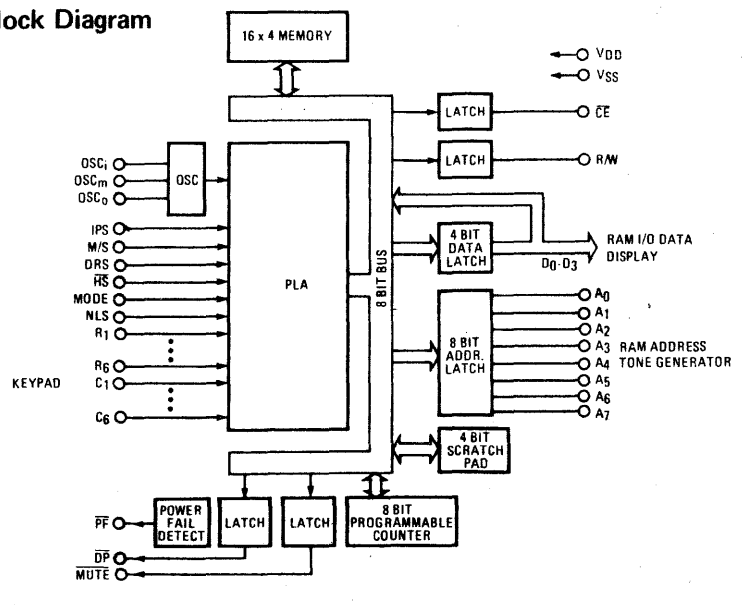
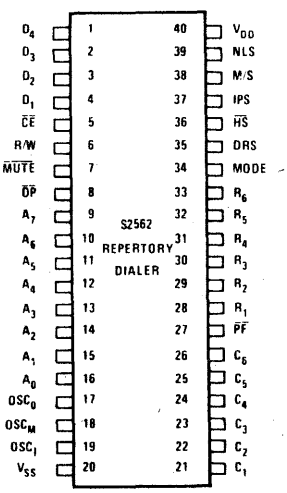
REPERTORY DIALER

Features



- ☐ CMOS Process Achieves Low Power Operation
- ☐ 8 or 16 Digit Number Capability (Pin Programmable)
- ☐ Dial Pulse and Mute Output
- ☐ Tone Outputs Obtained by Interfacing with Standard AMI S2559 Tone Generator
- ☐ Two Selections of Dial Pulse Rate
- ☐ Two Selections of Inter-Digit Pause
- ☐ Two Selections of Mark/Space Ratio (33-1/3 / 66-2/3 or 40/60)
- ☐ Memory Storage of 32 8-Digit Numbers or 16 16-Digit Numbers with Standard AMI S5101 RAM
- ☐ 16-Digit Memory for Input Buffering and for Redial with Access Pause Capability
- ☐ Accepts the Standard Telephone DPCT Keypad or SPST Switch X-Y Matrix Keyboards; Also Capable of Logic Interface
- ☐ Ignores Multi Key Entries
- ☐ Inexpensive, but Accurate R-C Oscillator Design Provides Better Than ±3% Accuracy Over Supply Voltage, Temperature and Unit-Unit Variations and Allows Different Dialing Rates, IDP and Tone Drive Timing by Changing the Time Base
- ☐ Power Fail Detection
- ☐ BCD Output with Update for Number Display Applications

General Description



The S2562 Repertory Dialer is a CMOS integrated circuit that can perform storing or retrieving, normal dialing, redialing or auto dialing and displaying of one of several telephone numbers. It is intended to be used with the AMI standard S5101—256x4 RAM that functions as telephone number storage. With one S5101 up to 32 8-digit or 16 16-digit numbers can be stored. It can provide either dial pulses or DTMF tones with the addition of the AMI S2559 tone generator for either the dial or tone line applications.

Data subject to change at any time without notice. These sheets transferred for information only.

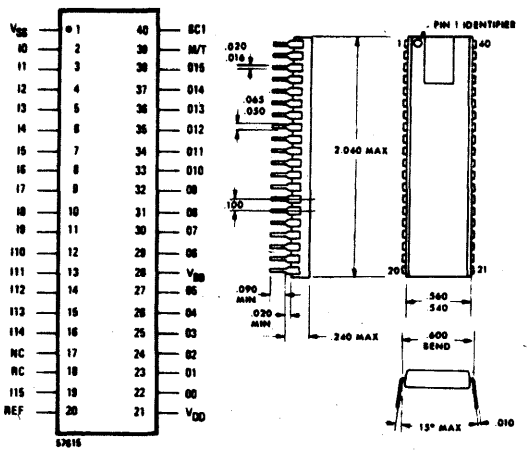
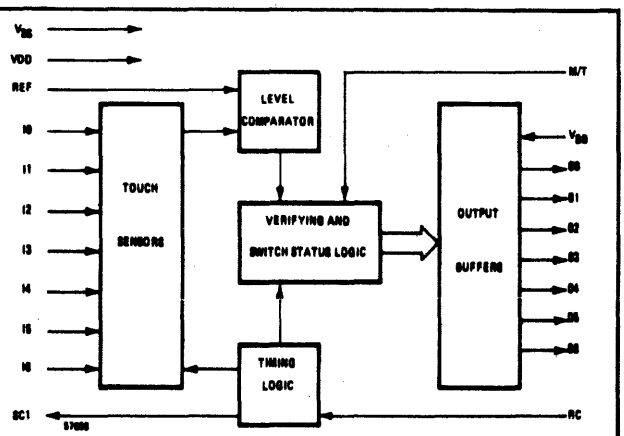
TouchControl™ Interface



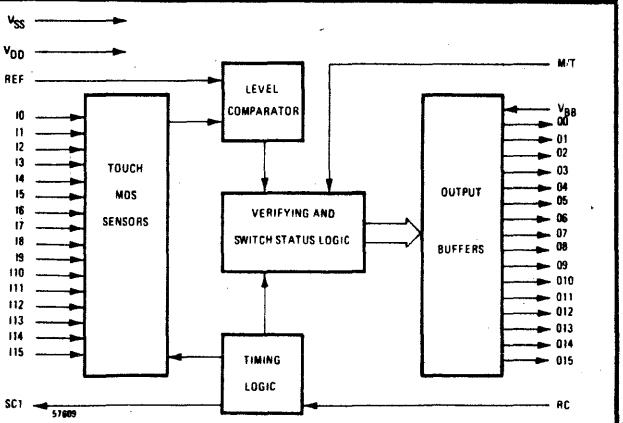
Features

- Interfaces with up to 16 Touch Switches
- Eliminates Contact Noise
- Comparator Sensing Permits Use with Wide Variety of Touch Switch Configurations
- Momentary or Toggle Operation Electrically Selectable
- Outputs are TTL/CMOS/MOS Compatible
- Simplifies Design of Touch-Sensitive Switches

ADVANCED PRODUCT DESCRIPTION



PIN/PACKAGE CONFIGURATION
S9260/S9261



PIN/PACKAGE CONFIGURATION
S9263/S9264/S9265

General Description

These TouchControl interface circuits can be connected to either seven (S9260/S9261) or sixteen (S9263/S9264/S9265) touch switches. For each switch input, there is a corresponding separate output. The outputs are open drain with their sources connected in common to supply input V_{BB}. This permits the driving of TTL as well as MOS circuits, by varying the V_{BB} voltage. The M/T input controls operation of the outputs. In the momentary mode (M) output is active only while the touch switch is being activated (touched by the operator). In the toggle mode (T), alternate actuations of a touch switch will cause its associated output to latch either on or off. On the S9260 and S9263, the M/T input affects all outputs. On the S9261, S9264, and S9265, several switch inputs are permanently fixed in the momentary mode, thus allowing both momentary and toggle switch actuation to be implemented simultaneously.

SC1	Scan clock output:					Max. capacitive loading < 150 pF
	Output low voltage	V_{SS}		- 1.5		
	Output high voltage			V_{DD}		

OPERATION

Device operation can be understood by referring to Figure 1, depicting a typical application of the S9263. Each of the sixteen pairs of series capacitors labeled S1 – S16 is one touch switch located on a TouchControl panel. (For details on touch panel configuration and operation, see the TouchControl application note included in this APD.) In each capacitor pair, the two common plates represent the conductive area on the control panel surface that is to be touched. The other two plates are formed by two conductive surfaces parallel to the touched surface and located directly under it on the reverse side of the panel. Referring again to Figure 1, the S9263 generates a clock signal on output SC1 that is applied to one plate of each capacitor pair; this signal passes through the two series capacitors and is detected in the MOS circuit. When a panel switch surface is touched, the signal level into the chip dimishes, and the on-chip differential amplifier senses the change and performs the appropriate switching function. For example, if surface S1 is touched, the signal at input 13 decreases, and output 03, normally open, now becomes active and drives the S1 input to the TTL circuitry toward voltage level V_{BB}.

I INPUTS

Inputs from the touch switch pads to the TouchControl circuit are labeled I0 through I15 (S9263, S9264, and S9265) or I0 through I6 (S9260 and S9261). Each I input relates directly to an O output of identical numeral.

RC INPUT

A resistor connected to V_{DD} and a capacitor connected to V_{SS} are connected to the RC input pin to establish the on-chip clock frequency that controls the touch switch delay time. Nominal values for these components are suggested in Figure 1, but they may be varied to change clock frequency over a range of 50 kHz to 100 kHz.

REF INPUT

In order to allow flexibility in the choice of TouchControl panel materials, switch layout, and switch size, AMI Touch Control inputs have been designed to detect a differential change rather than an absolute change in level. To obtain a reference level, two resistors are connected to input REF, one to V_{SS} and the other to V_{DD}.

O OUTPUTS

Each output pin labeled "O" corresponds to an input pin labeled "1." Whenever an input is selected, the output becomes active and will drive an external load toward supply voltage V_{BB}. When outputs are not active, they are high impedance open drain.

V_{BB} SUPPLY

The sources of all output devices are common and connected to pin V_{BB}. This allows TTL compatibility as shown in Figure 1, as well as the ability to drive higher level signals. For instance, if V_{SS} = 0 volts, V_{DD} = - 16 volts, and V_{BB} = V_{SS}, then active outputs would drive a load connected to V_{DD} towards V_{SS}. The V_{BB} pin can be used also to switch analog signals; in this configuration the analog signals are applied to the "O" pins and V_{BB} is the output pin.

M/T INPUT

The M/T input pin selects the mode of switch operation, either momentary or toggle. With no connection to the M/T pin momentary operation is selected, and appropriate outputs are active only for the duration of touching a switch. In this mode, no output is active when no switch is touched. A V_{DD} level applied to M/T causes the circuit to operate in the toggle mode. In this condition, the brief touch of any switch will turn on the appropriate output, which will remain latched on until the switch is touched again. Subsequent activations of the switch will toggle the corresponding output on and off alternately. To reset all outputs when the toggle mode is selected, a pulse of V_{SS} level may be applied to the M/T input.

SCI OUTPUT

The SC1 output provides the clock signal for the Touch-Control panel. Its frequency is determined by the RC time constant, and it is connected in common with one of each of the two common conductive surfaces on the reverse side of the touch panel.

MOMENTARY AND TOGGLE COMBINATION

The S9261, S9264, and S9265 contain several outputs that are permanently in the momentary mode of operation. With the M/T input at V_{SS} these parts function identically to the S9260 and S9263. With M/T at a logic 1 level, however, the S9261 has four momentary and three toggle inputs. Table 1 shows the combinations available on all three parts.

TABLE 1. COMPARISON OF FEATURES

Part Number	Pin Count	Touch Switch Capacity			Number of Outputs
		Total Touch Switch Interface Capability	Touch Inputs Selectable For Either Momentary Or Toggle Operation Through Use of M/T Input	Touch Switch Inputs Fixed In Momentary Operation (Not affected by state of M/T input)	
S9260	22	7	7	0	7

S9262/S9266
MULTIPLEXED TOUCHCONTROL INTERFACE

GENERAL DESCRIPTION

The S9262 and S9266 TouchControl interface circuits permit almost any control panel containing mechanical switches to be easily replaced by a flat-surface capacitive control panel providing superior styling, reliability, ease of cleaning, and safety. Connecting directly to a screened or etched pattern on the panel's reverse side, these MOS circuits provide outputs to drive a variety of logic systems from household appliances to industrial controls. All system functions are then selected by merely touching the flat conductive TouchControl "switch" areas that have been deposited on the panel's front surface in practically any configuration desired.

These circuits can operate up to 32 TouchControl switches, and their outputs are encoded for easy interfacing with microprocessors. For applications requiring an individual output for each TouchControl switch, refer to AMI's S9260, S9261, S9263, S9264 and S9265.

FUNCTIONAL DESCRIPTION

Fabricated with P-channel ion implanted MOS/LSI technology, AMI TouchControl integrated circuits* are designed to interface with a variety of touch panel switches and provide a high degree of flexibility in the selection of touch panel materials, layout of touch pad configurations, and design of switching functions. These parts are designed to address an array of TouchControl switches in either a 2 x 7 matrix (S9262) or a 2 x 16 matrix (S9266) to interface with a total of either 14 or 32 switches. The outputs are binary encoded for easy interfacing with microprocessors or TTL, CMOS or MOS logic.

Both momentary and "push on - push off" (toggle) switching operations are available on AMI TouchControl circuits and are electrically selected by the logic level of the M/T input pin. To ensure reliable switch action, a built in delay is incorporated in all circuits requiring a minimum touch time for switch response.

TYPICAL APPLICATIONS

- Appliance Control Panels
- Home Entertainment Systems
- Power Tool Controls
- Televisions
- Automotive Controls
- Telephones
- Games
- Fast Food Waterproof Keyboards
- Moisture Proofing
- Industrial Controllers
- Computer Terminals
- Keyboards
- Instrumentation
- 16 to 1 Multiplexers
- Microprocessor Interface
- Vending Machines
- Cash Registers

ABSOLUTE MAXIMUM RATINGS

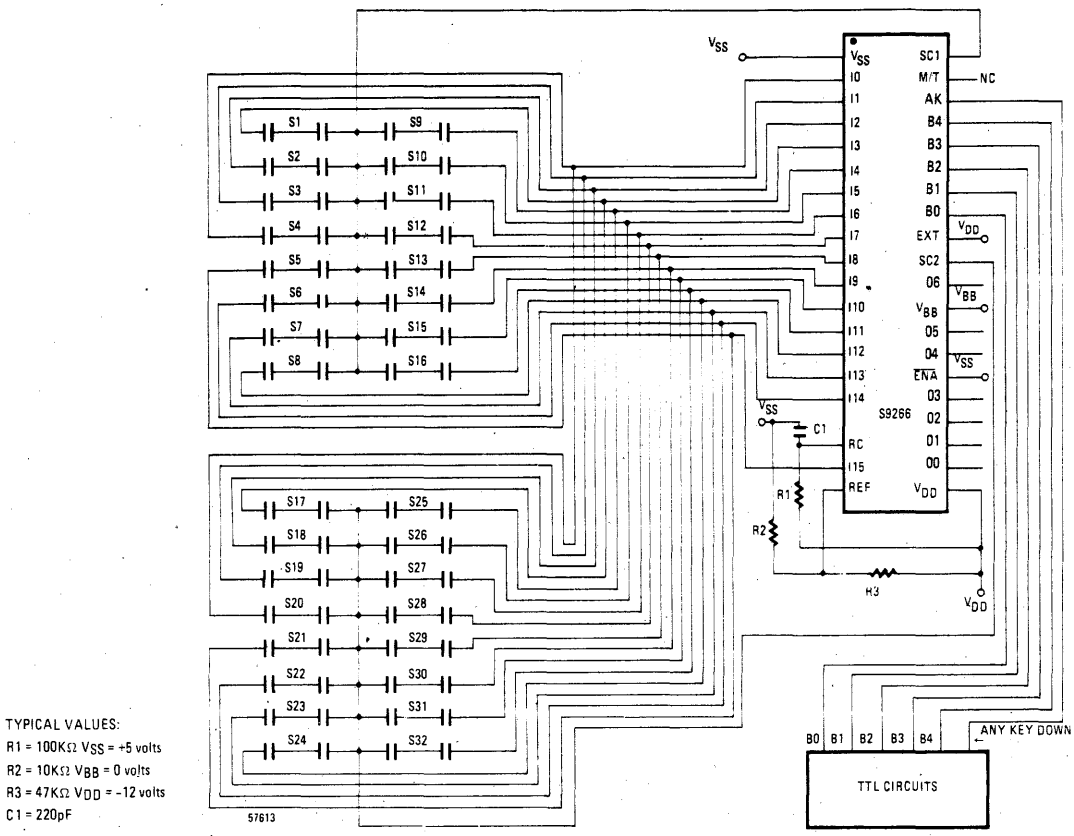
I_{DD}	Supply Current		7.0	15.0	ma	Outputs unconnected

OPERATION



Device operation can be understood by referring to Figure 1, depicting a typical application of the S9266. Each of the 32 pairs of series capacitors labeled S1 – S32 is one touch switch located on a TouchControl panel constructed of glass, printed circuit board, epoxy, or other dielectric material. (For details on touch panel configuration and operation, see the TouchControl application note included in this APD.) In each capacitor pair, the two common plates represent the conductive area on the control panel surface that is to be touched. The other two plates are formed by two conductive surfaces parallel to the touched surface and located directly under it on the reverse side of the panel. Referring again to Figure 1, the S9266 generates a clock signal on output SC1 and a similar signal on output SC2. The SC1 clock output is connected to the common conductors of 16 of the 32 touch switches; the SC2 clock connects to the remaining 16 switches. For each touch switch the clock signal passes through the two series capacitors and is detected in the MOS circuit. When a panel switch surface is touched, the signal level into the chip diminishes, and the on-chip differential amplifier senses the change and performs the appropriate switching function.

I INPUTS

Inputs from the touch switch pads to the TouchControl circuit are labeled I0 through I15 (S9266), or I0 through I6 (S9262). The I inputs in conjunction with SC1 and SC2 outputs form a touch switch matrix of 2 x 16 or 2 x 7, respectively. In both these parts the outputs are binary coded and will be described later.

TYPICAL VALUES:
R1 = 100KΩ V_{SS} = +5 volts
R2 = 10KΩ V_{BB} = 0 volts
R3 = 47KΩ V_{DD} = -12 volts
C1 = 220pF

FIGURE 1. 32 SWITCH APPLICATION USING S9266

RC INPUT

A resistor connected to V_{DD} and a capacitor connected to V_{SS} are connected to the RC input pin to establish the on-chip clock frequency that controls the rate of multiplexing and the touch switch delay time. Nominal values for these components are suggested in Figure 1, but they may be varied to change clock frequency over a range of 50kHz to 100 kHz.

REF INPUT

In order to allow flexibility in the choice of TouchControl panel materials, switch layout, and switch size, AMI TouchControl inputs have been designed to detect a differential change rather than an absolute change in level. To obtain a reference level, two resistors are connected to input REF, one connected to input REF, one connected to V_{SS} and the other to V_{DD}.

V_{BB} SUPPLY

The sources of all output devices (both "O" and "B" outputs) are common and connected to pin V_{BB}. This allows TTL compatibility as shown in Figure 1, as well as the ability to drive higher level signals. For instance, if V_{SS} = 0 volts, V_{DD} = - 16 volts, and V_{BB} = V_{SS}, then active outputs would drive a load connected to V_{DD} towards V_{SS}.

M/T INPUT

The M/T input pin selects the mode of switch operation, either momentary or toggle. Applying V_{SS} to the M/T pin selects momentary operation in which appropriate outputs are active only for the duration of touching a switch. In this mode, no output is active when no switch is touched. A V_{DD} level applied to M/T causes the circuit to operate in the toggle mode

S9262/S9266
MULTIPLEXED TOUCHCONTROL INTERFACE

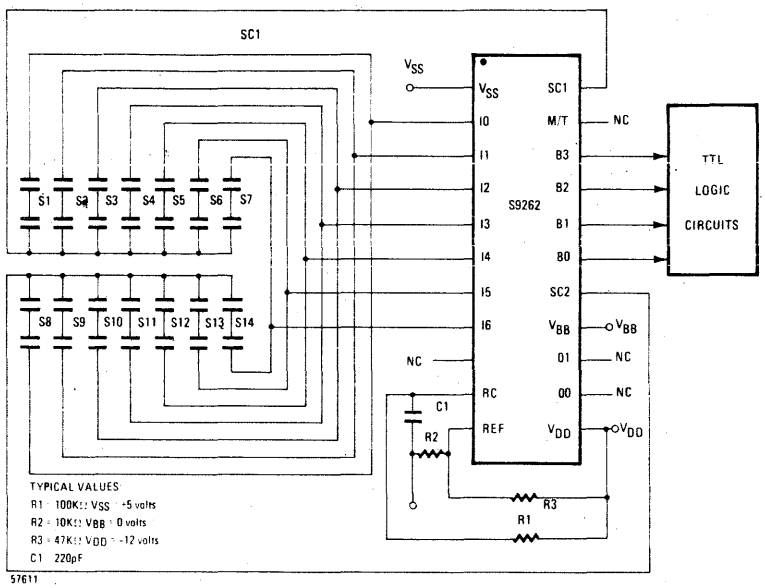

FIGURE 2. 14 SWITCH APPLICATION USING S9262

for "push-on, push-off" operation. Subsequent activation of the switch will toggle the corresponding output on and off alternately. It should be noted that each input should be cleared to the off state before selecting a new input to obtain meaningful data from the binary outputs. To reset all outputs when the toggle mode is selected, a pulse of V_{SS} level may be applied to the M/T input.

SC1 and SC2 OUTPUTS

The S9262 and S9266 have multiplexed inputs, using 2 x 7 and 2 x 16 matrices, respectively, to provide 14 and 32 input states. Clock signals SC1 and SC2 are used along with the "I" inputs to form these matrices as connected in the schematic of Figure 1.

O OUTPUTS

Each output pin labeled "O" corresponds to an input pin labeled "I". Whenever an input is selected, the output becomes active and will drive an external load toward supply voltage V_{BB}. This is true for momentary operation only; toggle operation is described in the section labeled "MT input." When "O" outputs are not active, they are high impedance open drain.

B AND AK OUTPUTS

The S9262 has four and the S9266 has five outputs labeled "B." These supply a binary code relating to the state of the inputs. Fourteen unique states are available on S9262 and thirty-two on S9266. The output configuration is identical to the "O" outputs. An extra output labeled AK is available on the S9266 and is active whenever any key is selected.

©IC MASTER 1979

S9262/S9266
MULTIPLEXED TOUCHCONTROL INTERFACE

ENA INPUT

Available on the S9266, the ENA input allows the outputs to be bussed and may be gated off by application of a logic 1 level. V_{SS} applied to the input enables all five outputs and AK.

EXT

The EXT pin is used in the output circuitry and should be connected to V_{DD}.

TOUCHCONTROL APPLICATION NOTES

PANEL CONSTRUCTION

A TouchControl switch panel consists of a single sheet of a rigid material with conductive surfaces applied on both sides as shown in Figure 3.

A number of materials may be used for touch panels, the selection of the material most suited for a particular application being dependent on such things as durability, appearance, ease of assembly, cost, and dielectric constant of the material.

Regardless of the selected panel material, a touch switch is formed by applying a single conductive surface to its front surface with two other conductive surfaces applied directly in line on the reverse side of the panel. Figure 3 shows three views of a typical touch panel containing two TouchControl switches. On switch one, conductive surface A is applied to the front of the panel and is the surface to be touched to effect a switch closure. Surfaces B and C are applied directly in line with A on the opposite side of the panel. A should cover completely and may overlap surfaces B and C.

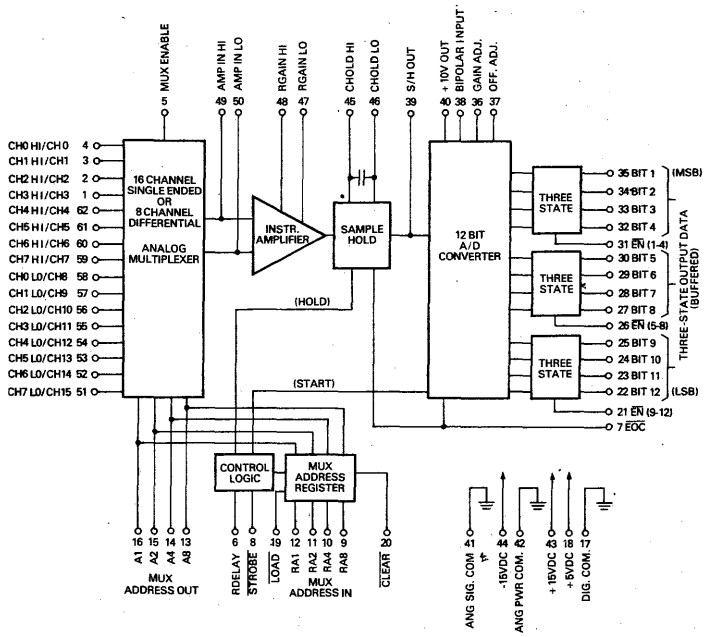
12 BIT HYBRID DATA ACQUISITION SYSTEMS

DATEL SYSTEMS, INC.

FEATURES

- **12 Bit Resolution**
- **8 or 16 Channels**
- **Internal Instrumentation Amp**
- **50 kHz Throughput Rate**
- **Three State Outputs**

The HDAS-8, with 8 differential input channels, and the HDAS-16, with 16 single ended input channels, are industry's first complete 12 bit data acquisition systems in a single hybrid package. Acquisition and conversion times combined are 20μsec. maximum, giving a 50 kHz throughput rate. The 12 bit output data can be transferred out in three 4 bit bytes by means of three state data bus drivers. Output coding is straight binary for unipolar operation and offset binary for bipolar operation.



The HDAS circuitry includes an analog multiplexer, programmable gain instrumentation amplifier, sample-hold circuit with MOS hold capacitor, 10 volt buffered reference, 12 bit A/D converter, three state bus driver and digital control circuitry. The instrumentation amplifier can be programmed by a single external resistor for gains from 1 to 1000. This is an important feature for processing signals in the range of 10mV to 10 V full scale.

*at maximum throughput rate

©IC MASTER 1979

The internal sample-hold device has excellent characteristics and has its own self contained MOS hold capacitor. Aperture delay time is 100nsec. and hold mode droop is 1μV/μsec. Nonlinearity error is less than ½ LSB and total error is 1 LSB maximum at 50 kHz throughput rate.

The HDAS units are especially useful for microcomputer based measurement and control systems. The package is a miniature 2.3 × 1.4 × 0.24 inches (58 × 36 × 6 mm) with 62 pins.

ADC-EK SERIES

MONOLITHIC INTEGRATING A/D CONVERTERS

DATEL SYSTEMS, INC.

FEATURES

- **Charge Balancing Type**
- **Binary or BCD Models**
- **20 mW Power Consumption**
- **No Missing codes**
- **8, 10, 12 Bit Resolution**

The ADC-EK series are low power, integrating A/D converters fabricated on a single monolithic chip using CMOS technology. The circuit employs a charge balancing integrator, current switch, comparator, clock counter, data counter, and control logic circuitry to implement conversion. The charge balancing integration technique gives high linearity and noise immunity along with inherent monotonicity resulting in no missing codes. Output data appears in parallel form on latched outputs which are CMOS, low power TTL, or low power Schottky TTL compatible. The ADC-EK series consists of 5 different models with 8, 10, and 12 bit binary coding and 3½ digit BCD coding.

Conversion time is 1.8 to 24 milliseconds maximum depending on model. Nonlinearity is ±½ LSB max. while differential nonlinearity is ±¼ LSB typical.

ADC-ET SERIES

CMOS A/D'S WITH 3-STATE OUTPUTS

DATEL SYSTEMS, INC.

FEATURES

- **Monolithic CMOS**
- **3-State Outputs**
- **8, 10, 12 Bit Resolution**
- **¼ LSB Typical Linearity**
- **Integrating Type**

The ADC-ET series devices are low cost 8, 10, and 12 bit integrating A/D converters optimized for high accuracy, linearity and noise immunity. They operate at low power consumption, with sufficient speed to handle most industrial and instrumentation requirements. Discretely controllable three state outputs allow bus organized output connections making these units ideal for microprocessor interfacing.

Fabricated with monlithic CMOS techniques, each device is housed in a 24-pin dual in-line package. The converter consists of an integrating operational amplifier, comparator, current switch, internal clock, two counters, latching output buffers and control logic circuitry. Operation of the circuit requires only a few external passive components and connection to external reference and power supplies.

ADC-MC8B

LOW COST, 8 BIT MONOLITHIC A/D CONVERTER

DATEL SYSTEMS, INC.

FEATURES

- **8 Bit Resolution**
- **Internal 2.5 V Reference**
- **+5 V Supply Operation**
- **Operates as A/D or D/A**
- **Low Cost**

The ADC-MC8B is an 8 bit monolithic, multifunction converter which operates from a single +5 V supply. This device can be operated as either an A/D or D/A converter by means of external pin connections. As a D/A converter it is complete, including an internal 2.5 V reference; the output voltage is 0 to +2.55 V when using the internal reference. When operating as an A/D converter, two external IC's are required: a 311 type comparator, and a 74132 type quad NAND gate. An internal counter develops the output code word with 500 μsec. required for a full scale conversion.

The ADC-MC8B design consists of eight current switches, a diffused resistor R-2R ladder network, a 2.5 V band gap reference, an 8 bit binary counter, and eight logic select switches. The logic select switches have a control input which determines whether the switches provide TTL outputs or accept TTL inputs. This converter can also be used with an external reference.

SPECIFICATIONS, Typical at 25°C

ADC-HC12B

12 BIT, LOW POWER A/D CONVERTER

DATEL SYSTEMS, INC.

INTERFACE

Datel

FEATURES

- **Single Supply Operation**
- **CMOS Circuitry**
- **12 Bit Resolution**
- **6 Input Voltage Ranges**
- **26 mW Consumption at 1000 Conversions/Sec.**

The ADC-HC12B is a complete, low power 12 bit A/D converter utilizing CMOS circuitry. It is specifically designed for portable and remote instrumentation applications where low power consumption is essential; this unit operates from either a single +9 VDC to +15 VDC power source (interrupt mode) or from a dual ±9 VDC to ±15 VDC source (continuous mode). In the interrupt mode of operation the converter is initially in standby mode, drawing only 10 μA of current from the supply until a start convert pulse is applied to it. With the pulse applied the converter turns on, stabilizes, and then performs a 12 bit conversion and returns to the standby mode while the 12 bit data word is held at the output.

Power consumption is 112 milliwatts in the continuous mode and 26 milliwatts in the interrupt mode at 1,000 conversions per second. There are six different analog input voltage ranges.

SPECIFICATIONS, Typical at 25°C

	ADC-HC12B
Resolution	12 Bits
Conversion Time, continuous mode	305 μsec. max.
Conversion Time, interrupt mode	350 μsec. max.
Gain Tempco, max.	30 ppm/°C
Nonlinearity Error, max.	½ LSB
Differential Nonlinearity, max.	½ LSB
Differential Nonlinearity Tempco	2 ppm/°C of FSR

ADC-HS12B

12 BIT A/D CONVERTER WITH SAMPLE HOLD

DATEL SYSTEMS, INC.

FEATURES

- **Internal Sample-Hold**
- **6 μsec. Acquisition Time**
- **8 μsec. Conversion Time**
- **12-Bit Resolution**
- **Programmable Input Ranges**

The ADC-HS12B is a high performance 12 bit A/D converter combined with a sample-hold in a miniature 32 pin package. It is specifically designed for systems applications where the sample-hold is an integral part of the conversion process. The sample hold has a 6 μsec. acquisition time and the A/D converter has an 8 μsec. conversion time. Five input voltage ranges are programmable by external pin connection. The input impedance to the sample-hold is 100 megohms, permitting direct connection to an analog multiplexer.

This converter incorporates proven thin film hybrid technology used in high volume production. The thin film resistor network is fabricated of nichrome on glass and then actively laser trimmed for best linearity. Other features include 20 ppm/°C gain tempco, 2 ppm/°C differential nonlinearity tempco and no missing codes over the operating temperature range.

SPECIFICATIONS, Typical at 25°C

ADC-HU3B

3 BIT EXPANDABLE FLASH A/D CONVERTER

DATEL SYSTEMS, INC.

NOTE: R = 23.5 ohms

FEATURES

- **3 Bits Plus Overrange**
- **50 MHz Conversion Rate**
- **0.1% Linearity**
- **Expandable Building Block**
- **Parallel (Flash) Technique**

The ADC-HU3B is an ultra-fast, 3 bit A/D converter using the flash (or parallel) conversion technique. Using thin-film hybrid construction this device performs a conversion every 20 nanoseconds maximum, giving a 50 MHz conversion rate. It is a miniature building block circuit which can be used alone as a 3 bit A/D, with two units corrected together for a 4 bit A/D, or with four units connected together for a 5 bit A/D. There are two sets of digital outputs: one directly from the comparator outputs gives a "thermometer scale" output; the other is a 3 bit decoded binary output with an overrange bit.

The ADC-HU3B is fabricated using a bank of 8 ultra-fast monolithic analog comparators. A 160 ohm tapped thin-film resistor network biases the comparators and is connected to an external voltage reference: the network is actively laser trimmed to give 0.1% linearity.

SPECIFICATIONS, Typical at 25°C

	ADC-HU3B

ADC-HX12B

12 BIT, LOW COST A/D CONVERTER

DATEL SYSTEMS, INC.

FEATURES

- **12 Bit Resolution**
- **20 μsec. Conversion Time**
- **5 Programmable Ranges**
- **100 Megohm Buffer**
- **Lowest Cost**

The ADC-HX12B is a very low cost, 12 bit A/D converter which is functionally complete. It is fabricated with thin film hybrid technology to perform a conversion in 20 μsec. By means of external pin connections it can be programmed for 5 different input voltage ranges. An internal 100 megohm buffer is provided for high input impedance applications.

The circuit consists of a 12 bit DAC which employs quad current switches, a precision zener reference, a fast comparator, clock, successive approximation register, and buffer amplifier. A nichrome thin film resistor network is actively laser trimmed to achieve optimum linearity.

Output data is available in both parallel and serial forms. This converter can also be short cycled to achieve faster conversions at lower resolutions.

SPECIFICATIONS, Typical at 25°C

	ADC-HX12B
Resolution	12 Bits
Conversion Time, max.	20 μsec.
Gain Tempco, max.	20 ppm/°C

ADC-HZ12B

12 BIT, HIGH PERFORMANCE A/D CONVERTER

DATEL SYSTEMS, INC.

FEATURES

- **8 μsec. Conversion Time**
- **20 ppm/°C Tempco**
- **5 Programmable Ranges**
- **Short Cycle Capability**
- **100 Megohm Buffer**

The ADC-HZ12B features high conversion speed in a hybrid 12 bit A/D converter. By employing a low capacitance nichrome-on-glass thin film resistor network, a conversion time of only 8 μsec. is achieved. This converter also has 5 different input voltage ranges determined by external pin connection and a 100 megohm buffer which may be connected if desired.

This ADC-HZ12B is functionally complete, incorporating a 12 bit DAC, precision reference, fast comparator, successive approximation register, a clock, and buffer amplifier. The thin film resistor network has excellent tracking characteristics resulting in no missing codes over the operating temperature range. The network is functionally laser trimmed.

Output coding is complementary binary, complementary offset binary, or complementary two's complement. Provision is made for precise, external adjustment of offset and gain.

SPECIFICATIONS, Typical at 25°C

DAC-08B

HIGH SPEED, MONOLITHIC 8 BIT D/A CONVERTER

DATEL SYSTEMS, INC.

INTERFACE

Datel

FEATURES

- **8 Bit Resolution**
- **85 nsec. Settling Time**
- **High Output Compliance**
- **1 or 2 Quadrant Multiplying**
- **Low Cost**

The DAC-08BC and DAC-08BM provide very high speed performance coupled with low cost and application flexibility. These units have guaranteed full 8-bit monotonicity with non-linearity of 0.19% over the full operating temperature range. High speed current steering switches achieve 85 nanosecond settling time with a very low glitch for full scale changes. A large output voltage compliance range (−10 to +18 Volts) allows direct current to voltage conversion with just an output resistor, omitting the need for an op amp in many cases.

The DAC-08 consists of 8 fast-switching current sources, a diffused R-2R resistor ladder, a bias circuit, and a reference control amplifier. The diffused resistor ladder gives excellent temperature tracking resulting in a gain temperature coefficient of 10 ppm/°C. The monolithic fabrication results in excellent linearity and tempco, fast output settling and low cost.

SPECIFICATIONS, Typical at 25°C

DAC-IC8B

LOW COST, MONOLITHIC 8 BIT D/A CONVERTER

DATEL SYSTEMS, INC.

FEATURES

- **8 Bit Resolution**
- **300 nsec. Settling Time**
- **½ LSB Linearity**
- **DTL/TTL Inputs**
- **Low Cost**

The DAC- IC8B is an 8 bit monolithic D/A converter designed for low cost and flexible application. It is packaged in a 16 pin DIP and requires only an external output amplifier and reference for operation. A full scale output change settles in 300 nanoseconds for a current output; this can be converted into a fast voltage output with a monolithic operational amplifier such as Datel System's AM-452. Digital input coding is straight binary for unipolar operation and offset binary for bipolar operation and is compatible with standard DTL/TTL logic.

The DAC-IC8B circuit consists of 8 fast switching current sources, a diffused resistor R-2R ladder network, a bias circuit, and a reference control amplifier. The diffused ladder network results in excellent linearity and temperature tracking. An external reference current of 2 mA must be supplied from the reference voltage source and the reference can be varied for one or two quadrant multiplying operations. Two models are available for the commercial and military temperature ranges.

SPECIFICATIONS, Typical at 25°C

	DAC-IC8B

DAC-UP8B

8 BIT MONOLITHIC DAC WITH INPUT REGISTER

DATEL SYSTEMS, INC.

FEATURES

- **Input Register**
- **Internal Reference**
- **Voltage Output**
- **Low Cost**
- **8 Bit Resolution**

The DAC-UP8BC and DAC-UP8BM are 8 bit monolithic DAC's with internal registers. Contained in the 22 pin DIP is a stable reference, a high-speed output amplifier and an 8 bit input latch. These microprocessor compatible converters are ideal for low cost applications. When the "load" input is low, the register is transparent and any change on the digital input pins will be reflected on the analog output. A low to high transition will latch this digital information and retain it until the "load" goes low. The output voltage range is 0 to +10 V for unipolar and ±5 V for bipolar. Typical settling time is 2 μsec for a full scale change.

The DAC design consists of 8 fast-switching current sources, a diffused R-2R resistor ladder network and a control amplifier. The diffused resistor network gives excellent temperature tracking resulting in a gain temperature coefficient of 20 ppm/°C. This bipolar monolithic device exhibits excellent linearity and temperature coefficients.

SPECIFICATIONS, Typical at 25°C

DAC-IC10BC

LOW COST, MONOLITHIC 10 BIT D/A CONVERTER

DATEL SYSTEMS, INC.

FEATURES

- **10 Bit Resolution**
- **Straight Binary Coding**
- **Current Output**
- **250 nsec. Settling Time**
- **TTL/CMOS Compatible**

The DAC-IC10BC is a low cost, 10 bit monolithic DAC with fast output current settling time. It is packaged in a 16 pin ceramic DIP and requires only an external reference and operational amplifier for voltage output operation. A full scale change in output current settles in 250 nanoseconds, and with a fast I.C. op amp (such as Datel System's AM-452) a 10V output change can settle within 1 microsecond. Digital input coding is straight binary for unipolar operation, and offset binary for bipolar operation; the logic inputs are compatible with TTL or CMOS.

This converter is manufactured with monolithic bipolar technology. The circuit incorporates 10 fast switching current sources which drive a diffused resistor R-2R network. The ladder network is laser trimmed by cutting aluminum links. The circuit also contains a reference control amplifier and a bias circuit. An external reference current of 2 mA is required at the + Reference input terminal.

The DAC-IC10BC has ±1 bit linearity with guaranteed monotonicity at room temperature and has a tempco of 20 ppm/°C.

SPECIFICATIONS, Typical at 25°C

DAC-681

MONOLITHIC 12 BIT D/A CONVERTER

DATEL SYSTEMS, INC.

FEATURES

- **12 Bit Resolution**
- **200 nsec. Settling Time**
- **5 ppm/°C Max. Gain Tempco**
- **5 Output Ranges**
- **562 Pin Compatible**

The DAC-681 is a new high performance monolithic 12 bit D/A converter fabricated with advanced bipolar technology. The circuit uses a precision, laser-trimmed thin film R-2R ladder network driven by equal-value switched current sources to achieve 1/4 LSB typical linearity, 200 nsec. settling time, and ±5 ppm/°C max. gain tempco.

The DAC-681 operates from TTL or CMOS input logic and provides a 0 to 5 mA or ±2.5 mA output current. The converter contains tracking feedback and bipolar offsetting resistors to provide five output voltage ranges when used with an external operational amplifier: 0 to +5V, 0 to +10V, ±2.5, ±5V, and ±10V. The DAC-681 features pin compatibility with 562 type DAC's while offering superior performance to these earlier devices.

SPECIFICATIONS, Typical at 25°C

DAC-HA10B, DAC-HA12B

DATEL SYSTEMS, INC.

LOW POWER CMOS 10 & 12 BIT MULTIPLYING D/A CONVERTERS

DAC-HA12B/D SHOWN

INTERFACE

Datel

FEATURES

- **10 & 12 Bit Resolution**
- **½ LSB Maximum Nonlinearity**
- **2 & 4 Quadrant Multiplying**
- **20 MHz Reference Bandwidth**
- **+5 V or +15 V Power Supply**

The DAC-HA series are high performance, multiplying digital to analog converters. They combine CMOS switches with laser trimmed nichrome thin film resistors to realize low power consumption with excellent linearity and drift characteristics. There are three models in this series: DAC-HA10B for 10 bit binary applications, DAC-HA12B for 12 bit binary applications and DAC-HA12D for 3 digit BCD applications. All units feature ±½ LSB maximum nonlinearity.

The thin film R-2R ladder network consists of 10K and 20K resistors with excellent tracking characteristics. The network provides a 10K input resistance to the required external reference, which can vary over ±12 V. The bandwidth for the reference input is 20 MHz. These devices are ideal for two and four quadrant multiplying applications and have output settling times of 1.3 & 5 μsec. Separate models are available for both +5 V and +15 V supply operation.

DAC-HA14B

HIGH RESOLUTION, MULTIPLYING CMOS D/A CONVERTER

DATEL SYSTEMS, INC.

FEATURES

- **14 Bit Resolution**
- **2 & 4 Quadrant Multiplying**
- **7μsec. Settling Time**
- **5 ppm/°C Tempco, Max.**
- **20 MHz Reference Bandwidth**

The DAC-HA14B is a 14 bit, CMOS multiplying D/A converter. There are two versions, offering a choice of either +5 V or +15 V power supply operation. The +5 V model draws only 1 μA quiescent current while the +15 V model draws 1.4 mA. The device is packaged in a 20 pin ceramic DIP package.

The combination of low ON resistance CMOS switches and a laser-trimmed nichrome thin film resistor network result in a maximum nonlinearity of ±1 LSB with 14 bit monotonicity at 25°C. The gain temperature coefficient of the circuit is 5 ppm/°C maximum. The resistor network is an R-2R ladder with resistance values of 10K and 20K ohms.

The input resistance to the ladder is 10K ohms for the external reference source, which may be ±12 V. Bandwidth for the reference input is 20 MHz. The DAC-HA14B incorporates internal protection on the power supply and digital input terminals to prevent latch-up problems.

SPECIFICATIONS, Typical at 25°C

DAC-HF SERIES

ULTRA-FAST, CURRENT OUTPUT D/A CONVERTERS

DATEL SYSTEMS, INC.

NOTE: FOR DAC-HF10B PINS 11 & 12 ARE NO CONNECTION
FOR DAC-HF8B PINS 9, 10, 11 & 12 ARE NO CONNECTION

FEATURES

- **8, 10, or 12 Bit Resolution**
- **25 nsec. Settling (8 or 10 Bits)**
- **50 nsec. Settling (12 Bits)**
- **Unipolar or Bipolar Operation**
- **5 mA Output Current**

The DAC-HF series features ultra-fast current outputs for 8, 10, and 12 bit resolutions. These state-of-the-art digital to analog converters give output settling times of 25 nanoseconds maximum for 8 and 10 bits and 50 nanoseconds maximum for 12 bits. They can be used to drive a load resistor directly for up to ±1.2 V outputs or with a fast inverting operational amplifier (Datel System's AM-500) for up to ±10 V outputs at sub-microsecond settling times. The required feedback resistors are incorporated inside the unit and give a selection of five different output ranges by external pin connection.

The circuit uses high speed PNP current switches combined with a low impedance R-2R ladder network. The network is fabricated with nichrome thin-film resistors which are then laser trimmed for optimum linearity. The output current is 0 to +5 mA or ±2.5 mA with a 400 ohm output impedance.

DAC-HK SERIES

HIGH PERFORMANCE 12 BIT DAC'S WITH INPUT REGISTER

DATEL SYSTEMS, INC.

FEATURES

- **12 Bit Resolution**
- **Input Register**
- **20 ppm/°C Tempco**
- **Binary, BCD, or 2's Comp. Coding**
- **3 μsec. Settling Time**

The DAC-HK series D/A converters are high performance 12-bit devices with a fast settling voltage output. They incorporate a level controlled input storage register and are specifically designed for systems applications such as data-bus interfacing with computers. When the "load" input is high data in the storage register is held, and when the load input is low data is transferred through to the DAC. There are three basic models available by coding option: binary, BCD, and two's complement. The output voltage ranges are externally pin-programmable and include: 0 to +2.5 V, 0 to +5 V, 0 to +10 V, ±2.5 V, ±5 V, and ±10 V.

Quad current switches are combined with a low T.C. thin film resistor network and a low T.C. Zener reference to achieve better than 20 ppm/°C gain tempco. Optimum linearity is attained by functional laser trimming of the thin film nichrome resistors.

DAC-HP16B, DAC-HP16D

HIGH RESOLUTION D/A CONVERTERS

DATEL SYSTEMS, INC.

INTERFACE

Datel

FEATURES

- **16 Bit Binary Model**
- **4 Digit BCD Model**
- **Linearity to 0.003%**
- **15 ppm/°C Tempco, Max.**
- **Voltage Output**

The DAC-HP series are high resolution D/A converters with voltage output. They are self-contained, including a low tempco zener reference circuit and output operational amplifier, all in a miniature 24 pin double spaced ceramic DIP package. There are two basic models in the series. The DAC-HP16B has 16 bit binary resolution with ±0.003% linearity while the DAC-HP16D has 4 digit BCD resolution with ±0.005% linearity. Input coding is complementary binary and complementary offset binary for the DAC-HP16B and complementary BCD for the DAC-HP16D. The binary version operates in both unipolar and bipolar modes with output voltages of 0 to +10 V and ±5 V; the BCD version operates in unipolar mode only with 0 to +10 V output.

The DAC-HP design incorporates thin film hybrid technology which has been in volume production. Selected low tempco nichrome on silicon thin film resistor networks are combined with tightly matched quad current switches to achieve 16 bit resolution.

DAC-HU4B

ULTRA-FAST, 4 BIT D/A CONVERTER

DATEL SYSTEMS, INC.

FEATURES

- **4 Bit Resolution**
- **25 nsec. Settling to 0.1%**
- **24 mA Output Current**
- **0.1% Linearity**
- **ECL 10,000 Input Logic**

The DAC-HU4B is an ultra-fast 4 bit hybrid DAC which is specifically designed as a building block component for use with Datel System's ADC-HU3B A/D converters in ultra high speed two stage A/D converters. The DAC-HU4B has a 15 line ECL 10,000 complementary input designed to be driven from two ADC-HU3B's. The output current is 24 mA with all of the current switches on and settling time to 0.1% is only 25 nsec. By connecting the input logic lines together in groups of 8, 4, 2, and 1, complementary binary coding can be realized.

In order to be used in higher resolution A/D converters, this device has a linearity of 0.1%.

The gain temperature coefficient of this circuit is 15 ppm/°C without the external reference. The power to this device is supplied from an operational amplifier which operates from an external reference. The nominal supply voltage is −5 V at 25 mA.

SPECIFICATIONS, Typical at 25°C

DAC-HZ12B SERIES

DATEL SYSTEMS, INC.

LOW COST, HIGH PERFORMANCE 12 BIT D/A CONVERTERS

FEATURES

- **12 Bits Binary**
- **3 Digits BCD**
- **5 Output Ranges**
- **3 μsec. Settling Time**
- **20 ppm/°C Tempco**

The DAC-HZ series are high performance, hybrid 12 bit binary and 3 digit BCD digital-to-analog converters. They are complete and self-contained with a precision internal reference and fast output operational amplifier. Pin programmable output voltage ranges are provided for a high degree of application flexibility; the output voltage ranges are 0 to +5 V, 0 to +10 V, ±2.5 V, ±5 V, and ±10 V with only unipolar ranges available on the BCD models.

The internal design utilizes three quad current switches, two thin film resistor networks, a precision zener reference circuit, reference control circuit and output amplifier. The thin film resistor networks are functionally trimmed with a laser to precisely set the binary weights of the current switches. The excellent tracking of the thin film resistors in conjunction with the tightly matched current switches results in a differential nonlinearity tempco of only 2 ppm/°C.

VFQ-1

MONOLITHIC VOLTAGE TO FREQUENCY CONVERTER

DATEL SYSTEMS, INC.

FEATURES

- **10 kHz to 100 kHz FS**
- **0.01% Typ. Linearity at 10 kHz**
- **25 ppm/°C Tempco**
- **Open Collector Output**
- **Pulse or Square Wave Output**

Model VFQ-1 is a new monolithic voltage to frequency converter using combined bipolar and CMOS technologies. This device accepts a positive analog input current and produces an output pulse train with a frequency linearly proportional to an input current. In addition to the pulse output, there is also a square wave output at half the pulse frequency. The full scale output pulse rate can be set from 10 kHz to 100 kHz by means of two external capacitors. Linearities are typically 0.01% for 10 kHz full scale and 0.1% for 100 kHz full scale; linearity holds all the way down to zero.

The VFQ-1 internal circuitry includes an operational integrator, a comparator, digital delay circuit, single-pole double-throw electronic switch, a start circuit, a divide by two circuit, and two output driver circuits. It operates on the well-known charge balancing integrator principle. The two outputs are open collector NPN which can sink up to 10 mA and give a logic HI output up to +18 volts.

SPECIFICATIONS Typical at 25°C

MX AND MV SERIES

MONOLITHIC CMOS ANALOG MULTIPLEXERS

DATEL SYSTEMS, INC.

INTERFACE

Datel

FEATURES

- **Dielectrically Isolated CMOS**
- **Break-Before-Make Switching**
- **4, 8, and 16 Channels**
- **Single Ended and Differential**
- **Low Power Consumption**

This broad line of monolithic CMOS multiplexers offers 4 through 16 channel performance. The MX series has overvoltage protected switches with 1.5K ON resistance for 4, 8, and 16 channel applications while the MV series provides a lower 270 ohm ON resistance. Both single ended and differential input versions are available.

These devices are fabricated with a dielectrically isolated complementary MOS process. The digital inputs are DTL, DTL, and CMOS compatible and address the proper channel switch by means of a 2, 3, or 4 bit binary code. An inhibit input enables or disables the entire device and thus permits expansion of the number of channels by using several multiplexers together. Another important feature is the use of break-before-make switching to insure that no two channels are ever momentarily shorted together.

These multiplexers are ideal for multi-channel data acquisition systems where the multiplexer operates into a high impedance load such as a buffer amplifier or sample-hold.

SHM-IC-1, SHM-LM-2

MONOLITHIC SAMPLE-HOLDS

DATEL SYSTEMS, INC.

INTERFACE

Datel

FEATURES

- **Acquisition Time to 5 μsec.**
- **0.01% Accuracy**
- **Bandwidth to 2 MHz**
- **0.01% Feedthrough**
- **Low Cost**

These monolithic sample-hold devices feature excellent performance specifications at a low price. They are self-contained units requiring only an external hold capacitor for operation. The SHM-LM-2 operates in a fixed gain configuration of +1 while the SHM-IC-1 can be externally connected for gains of ±1 or for higher gains by means of two external resistors. Both models consist of a high impedance input amplifier, a fast electronic switch, and a high impedance output buffer amplifier. The circuit operates in a closed loop configuration for maximum accuracy.

Accuracy is 0.01% for both models making them useful in 12 bit A/D converter applications. For a 1000pF hold capacitor the acquisition time is 5 μsec. for the SHM-IC-1 and 6 μsec. for the SHM-LM-2. Better accuracy with lower feedthrough and hold mode droop can be achieved by using higher value hold capacitance such as .01 μF.

SPECIFICATIONS, Typical at 25°C, C_H = 1000pF

SHM-6, SHM-HU

FAST, HYBRID SAMPLE-HOLDS

DATEL SYSTEMS, INC.

FEATURES

- **0.01% Accuracy (SHM-6)**
- **1.0 μsec. Acquisition Time (SHM-6)**
- **25 nsec. Acquisition Time (SHM-HU)**
- **50 MHz Bandwidth (SHM-HU)**
- **50 mA Output (SHM-6)**

These hybrid sample-hold circuits feature fast and ultra-fast acquisition times. The SHM-6 is designed for use with fast 12 bit A/D converters. Its accuracy is 0.01% and acquisition time is 1.0 μsec. maximum. Bandwidth is 5 MHz and aperture delay time is 20 nsec. In addition to its high accuracy and high speed this model also has a 50 mA output current. The input amplifier of the SHM-6 is an open loop transconductance amplifier which can be externally connected for closed loop gains of ±1 to ±10. The hold capacitor, of value 400pF, is included internally.

The SHM-HU is an ultra high speed sample-hold designed for video processing applications. It is specifically designed for use with Datel System's ADC-HU3B A/D converter and other ultra fast A/D's with resolutions up to 8 bits. It acquires a 5 V input change in just 25 nsec. and features a 10 psec. aperture uncertainty time. A 53 pF MOS hold capacitor is incorporated in the unit. The SHM-HU requires 4 external resistors and an external LH003 buffer amplifier.

AM-400 SERIES

WIDE BANDWIDTH, FAST SETTLING OPERATIONAL AMPLIFIERS

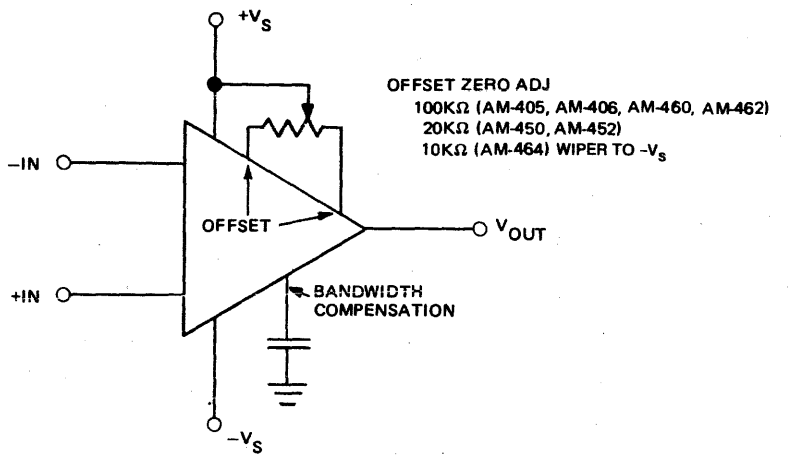
DATEL SYSTEMS, INC.

AM-462-1

FEATURES

- **Gain Bandwidth to 100 MHz**
- **Slew Rate to 120 V/μsec.**
- **FET or Bipolar Inputs**
- **Settling Time to 200 nsec.**
- **CMRR to 100 dB**

This broad line of monolithic operational amplifiers is specifically designed for data acquisition and conversion applications where high speed is required. These amplifiers feature large gain bandwidth products, high slew rate, and fast settling times. In addition to these high speed characteristics they also have excellent DC parameters, making them good choices for high accuracy applications. The DC characteristics include low input bias currents, high input impedance, low input offset voltage drift, and high common mode rejection.



Four basic models of bipolar input amplifiers are offered together with two FET input models. The AM-464-2 is a fast settling amplifier with ±35V output swing for use in high output voltage DAC's and other high voltage applications.

These amplifiers are also useful in many other applications such as sample-hold circuits, high impedance buffer amplifiers, fast signal summing and fast absolute value circuits.

AM-435

MONOLITHIC, FET INPUT INSTRUMENTATION AMPLIFIER

DATEL SYSTEMS, INC.

FEATURES

- **2 x 10^{12} Ohms Input Z**
- **0.02% Gain Linearity**
- **105 dB min. CMRR**
- **Low Noise JFET Inputs**
- **Single Resistor Gain Adjust**

DESCRIPTION

The AM-435 is a low cost, high performance, monolithic instrumentation amplifier. Tightly matched JFET input devices give very high input impedance with very low bias currents and low input offset voltage drift. The AM-435 is ideal for applications where high differential source impedances are encountered.

This amplifier is programmed by means of two external resistors, R_S and R_G. With R_S at a set value the gain may be varied from 1 to 1000 by changing R_G. Provision is also made for an external offset adjustment by means of a trimming potentiometer. Input impedance is 2 x 10^{12} ohms with bias currents of 40 pA maximum. Common mode rejection is greater than 105 dB at a gain of 1000. Input noise current is only 0.01 pA RMS and gain nonlinearity is typically 0.02%. The input offset voltage drift is typically 10μV/°C and output offset voltage drift is 600μV/°C.

AM-490-2

DATEL SYSTEMS, INC.

MONOLITHIC, DIFFERENTIAL INPUT CHOPPER STABILIZED OP AMP

FEATURES

- **Differential Inputs**
- **120 dB CMR**
- **Chopper Stabilized**
- **Drift as Low as 0.1 μV/°C**
- **5 x 10^8 Open Loop Gain**

Model AM-490-2 is a monolithic, chopper stabilized operational amplifier with differential inputs; it is specifically designed for applications requiring ultra-stable DC characteristics together with good bandwidth. This device is available in three different grades of maximum input offset voltage drift: 1.0, 0.3, and 0.1μV/°C. The extremely low input offset voltage drift and initial input offset voltage of only 20μV eliminate the requirement for zero adjustment in most applications. Other important input characteristics include an input impedance of 100 megohms, input bias current of 150pA, and input offset current drift of 1pA/°C. This permits the AM-490-2 to operate accurately with source impedances over 100 kilohms. A common mode rejection of 120 dB minimum and open loop gain of 5 x 10^8 result in extremely low output errors. Long term stability is typically 5μV per year.

AM-500

ULTRA-FAST HYBRID OP AMP

DATEL SYSTEMS, INC.

FEATURES

- **200 nsec. Settling to .01%**
- **1000V/μsec. Slew Rate**
- **100 MHz Gain Bandwidth**
- **10^6 Open Loop Gain**
- **50 mA Output Current**

The AM-500 series amplifiers are ultra-fast settling operational amplifiers for use in inverting applications. A unique feedforward amplifier design combines the characteristics of a low drift DC amplifier with those of a very fast AC amplifier. For optimum fast settling performance, this amplifier has an open loop gain roll-off of 6 dB per octave to beyond 100 MHz. Miniature thin-film hybrid construction permits an optimum combination of semiconductor devices and minimum lead lengths to realize the amplifier circuitry. Applications for the AM-500 series include fast integrators, sample-holds, fast waveform drivers, and fast D/A converter output amplifiers.

Output settling time is 200 nanoseconds max. to .01% for a 10 volt step change. Slew rate is 1000V/μsec. for positive output transitions and 1800V/μsec. for negative transitions. This high slew rate permits undistorted reproduction of a full load, 20V peak to peak sine-wave out to 16 MHz. Gain bandwidth product is 100 MHz minimum.

SPECIFICATIONS, Typical at 25°C

HI-200

Dual SPST CMOS Analog Switch

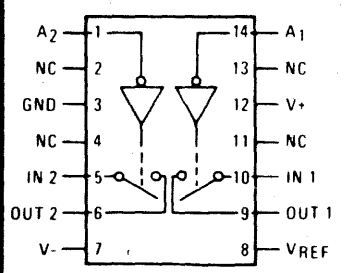
FEATURES

- ANALOG VOLTAGE RANGE ±15V
- ANALOG CURRENT RANGE 80mA
- TURN-ON TIME 240ns
- LOW R_{ON} 55Ω
- LOW POWER DISSIPATION 15mW
- TTL/CMOS COMPATIBLE
- NO DIGITAL INPUT CURRENT SPIKE

APPLICATIONS

- HIGH FREQUENCY ANALOG SWITCHING
- SAMPLE AND HOLD CIRCUITS
- DIGITAL FILTERS
- OP AMP GAIN SWITCHING NETWORKS

DESCRIPTION



HI-200 is a monolithic device comprising two independently selectable SPST switches which feature fast switching speeds (290ns) combined with low power dissipation (15mW at 25°C). Each switch provides low "ON" resistance operation for input signal voltages up to the supply rails and for signal currents up to 80mA. Employing Dielectric Isolation and Complementary CMOS processing, HI-200 operates without any applications problems induced by latch-up or SCR mode phenomena.

All devices provide break-before-make switching and are TTL and CMOS compatible for maximum application versatility. HI-200 is an ideal component for use in high frequency analog switching. Typical applications include signal path switching, sample and hold circuit, digital filters and op amp gain switching networks.

HI-200 is available in D.I.P. (TO-116) and metal (TO-100) cans. HI-200-2 is specified from -55°C to +125°C while HI-200-5 operates from 0°C to +75°C. HI-200 is functionally and pin compatible with other available "200 series" switches.

All devices provide break-before-make switching and are TTL and CMOS compatible for maximum application versatility. HI-201 is an ideal component for use in high frequency analog switching. Typical appliations include signal path switching, sample and hold circuit, digital filters and op amp gain switching networks.

HI-201 is available in a 16 lead dual-in-line package. HI-201-2 is specified from -55°C to +125°C while HI-201-5 operates from 0°C to +75°C. HI-201 is functionally and pin compatible with other available "200 series" switches.

HI-5040 thru HI-5051
HI-5046A and HI-5047A

CMOS Analog Switches

FEATURES

- WIDE ANALOG SIGNAL RANGE ±15V
- LOW "ON" RESISTANCE (TYP) 25Ω
- HIGH CURRENT CAPABILITY (TYP) 80mA
- BREAK-BEFORE-MAKE SWITCHING
  - TURN-ON TIME (TYP) 370ns
  - TURN-OFF TIME (TYP) 280ns
- NO LATCH-UP
- INPUT MOS GATES ARE PROTECTED FROM ELECTROSTATIS DISCHARGE
- DTL, TTL, CMOS, PMOS COMPATIBLE

APPLICATIONS

- HIGH FREQUENCY SWITCHING
- SAMPLE AND HOLD
- DIGITAL FILTERS
- OP AMP GAIN SWITCHING

DESCRIPTION

This family of CMOS analog switches offers low-resistance switching performance for analog voltages up to the supply rails and for signal currents up to 80mA. "ON" resistance is low and stays reasonably constant over the full range of operating signal voltage and current. R_{ON} remains exceptionally constant for input voltages between +5V and -5V and currents up to 50mA. Switch impedance also changes very little over temperature, particularly between 0°C and +75°C. R_{ON} is nominally 25 ohms for HI-5048 through HI-5051 and HI-5046A/5047A and 50Ω for HI-5040 through HI-5047.

All devices provide break-before-make switching and are TTL and CMOS compatible for maximum application versatility. Performance is further enhanced by Dielectric Isolation processing which insures latch-free operation with very low input and output leakage currents (0.8nA at 25°C). This family of switches also features very low power operation (1.5mW at 25°C).

There are 14 devices in this switch series which are differentiated by type of switch action and value of R_{ON} (see Functional diagram). All devices are available in 16 pin D.I.P. packages. The HI-5040/5050 switches can directly replace IH-5040 series devices and are functionally compatible with the DG 180/190 family. Each switch type is available in the -55°C to +125°C and 0°C to +75°C performance grades.

HI-1818A/1828A

Low Resistance 8 Channel CMOS Analog Multiplexers

FEATURES

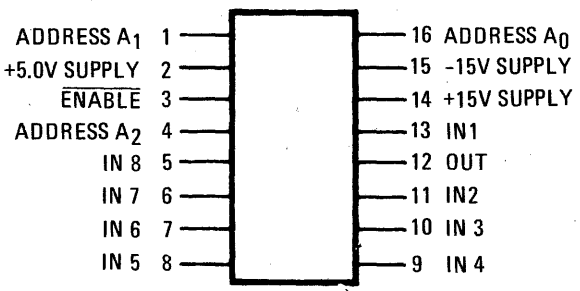
- SIGNAL RANGE ±15V
- "ON" RESISTANCE (TYP.) 250Ω
- INPUT LEAKAGE AT +125°C (TYP.) 20nA
- ACCESS TIME (TYP.) 350ns
- POWER CONSUMPTION (TYP.) 5mW
- DTL/TTL COMPATIBLE ADDRESS
- -55°C to +125°C OPERATION

APPLICATIONS

- DATA ACQUISITION SYSTEMS
- PRECISION INSTRUMENTATION
- DEMULTIPLEXING
- SELECTOR SWITCH

DESCRIPTION

The HI-1818A/1828A are monolithic high performance CMOS analog multiplexers offering built-in channel selection decoding plus an inhibit (enable) input for disabling all channels. Dielectric Isolation (DI) processing is used for enhanced reliability and performance (see Application Note 521). Substrate leakage and parasitic capacitance are much lower, resulting in extremely low static errors and high throughput rates. Low output leakage (typically 0.1nA) and low channel ON resistance (250 Ω) assure optimum performance in low level or current mode applications.



The 1818A is a single-ended 8 channel multiplexer, while the HI-1828A is a differential 8 channel version. Either device is ideally suited for medical instrumentation, telemetry systems, and microprocessor based data acquisition systems.

The HI-1818A-2 and HI-1828A are specified over -55°C to +125°C, while the -5 versions are specified over 0°C to +75°C.

HI-1840

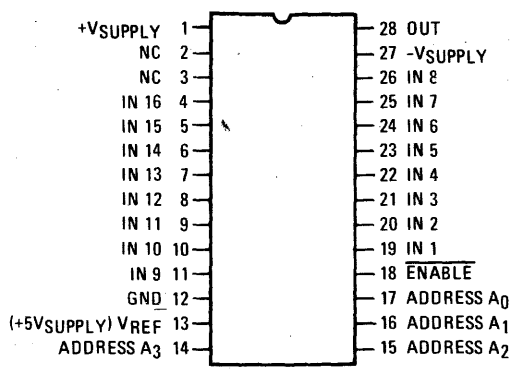
16 Channel CMOS Analog Multiplexer with High-Z Analog Input Protection

FEATURES

- HIGH ANALOG INPUT IMPEDANCE DURING POWER LOSS (OPEN) 500MΩ
- LOW POWER CONSUMPTION (STANDBY) 600μW
- ACCESS TIME 500ns
- EXCELLENT IN HI-REL REDUNDANT SYSTEMS
- BREAK-BEFORE-MAKE SWITCHING
- NO LATCH-UP

APPLICATIONS

- FAIL-SAFE DATA ACQUISITION SYSTEMS
- FAIL-SAFE TELEMETRY SYSTEMS
- AIRCRAFT INSTRUMENTATION AND CONTROL



DESCRIPTION

The HI-1840 is a monolithic 16 channel multiplexer constructed with the Harris Linear Dielectric Isolation CMOS process. It is designed to provide a high input impedance to the analog source if device power fails (open) or the analog signal voltage inadvertently exceeds the supply rails during powered operation. Excellent for use in redundant applications, since the secondary device can be operated in a standby unpowered mode affording no additional power drain. But more significantly, a very high impedance exists between the active and inactive devices preventing any interaction. One of sixteen channel selection is controlled by a 4-bit binary address plus an Enable-Inhibit input which conveniently controls the ON/OFF operation of several multiplexers in a system. All digital inputs have electrostatic discharge protection. The HI-1840 is tested and guaranteed within the military temperature range and is available in a 28 pin dual-in-line package.

HI-506A/HI-507A

16 Channel CMOS Analog Multiplexer with Overvoltage Protection

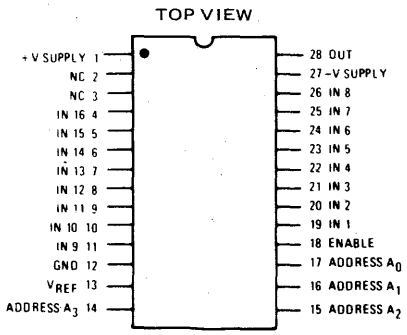
FEATURES

- ANALOG/DIGITAL OVERVOLTAGE PROTECTION
- FAIL SAFE WITH POWER LOSS (NO LATCHUP)
- BREAK-BEFORE-MAKE SWITCHING
- DTL/TTL AND CMOS COMPATIBLE
- ANALOG SIGNAL RANGE ±15V
- ACCESS TIME (TYP.) 500ns
- SUPPLY CURRENT AT 1MHz ADDRESS TOGGLE (TYP.) 4mA
- STANDBY POWER (TYP.) 7.5mW

APPLICATIONS

- DATA ACQUISITION
- INDUSTRIAL CONTROLS
- TELEMETRY

DESCRIPTION



The HI-506A and HI-507A are dielectrically isolated CMOS analog multiplexers incorporating an important feature; they withstand analog input voltages much greater than the supplies. This is essential in any system where the analog inputs originate outside the equipment. They can withstand a continuous input up to 10 volts greater than either supply, which eliminates the possibility of damage when supplies are off, but input signals are present. Equally important they can withstand brief input transient spikes of several hundred volts; which otherwise would require complex external protection networks. Necessarily, ON resistance is somewhat higher than similar unprotected devices, but very low leakage currents combine to produce low errors. Application Notes 520 and 521 further explain these features.

The HI-506A-2 and HI-507A-2 are specified over -55°C to +125°C while the -5 versions are specified over 0°C to +75°C.

HI-1080/1085

Precision Monolithic 8-Bit D to A Converter

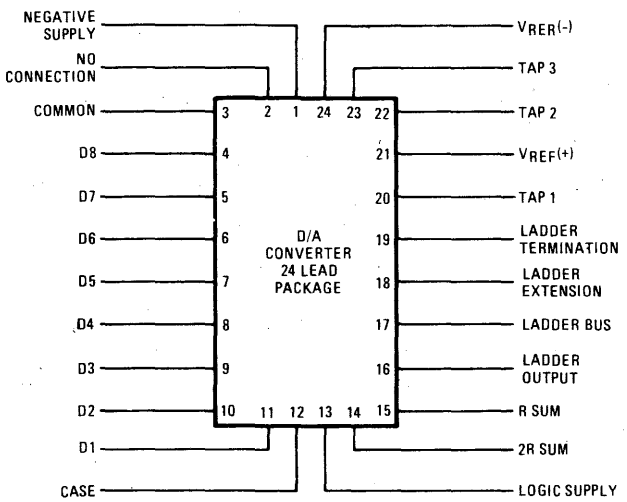
FEATURES

- GUARANTEED ±1 L.S.B. ACCURACY OVER TEMPERATURE
  - HI-1080 -55°C to +125°C
  - HI-1085 0°C to +75°C
- FAST SETTLING 1.5 μs to ½ L.S.B.
- EXPANDABLE FOR HIGHER RESOLUTIONS
- MONOLITHIC CONSTRUCTION
- DTL/TTL COMPATIBLE INPUTS
- RELIABLE MONOLITHIC CONSTRUCTION MEETS REQUIREMENTS OF MIL-STD-883

APPLICATIONS

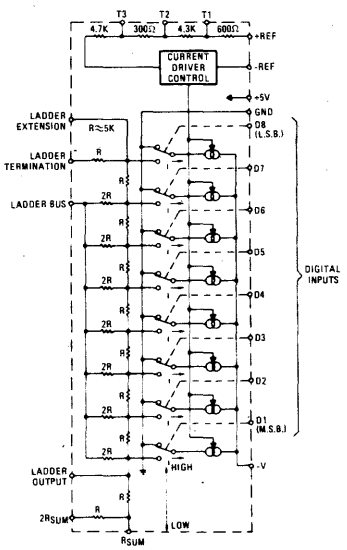
- WAVEFORM SYNTHESIZERS
- MICROPROCESSOR I/O INTERFACE
- HIGH REL APPLICATIONS
- A TO D CONVERTER (USING COMPARATOR AND DIGITAL LOGIC)
- DATA ACQUISITION SYSTEMS

DESCRIPTION



The HI-1080/1085 is a monolithic 8 bit digital-to-analog converter employing bipolar current switches feeding a thin film R-2R ladder network.

Because of the excellent stability of this device, it is practical to specify one all-inclusive accuracy parameter: ±1L.S.B. accuracy over the operating temperature range. This means that once the desired full scale output level is set at room temperature by adjustment of the input reference current, each of the 256 output levels will always measure within ±1 L.S.B. of the corresponding output of a "perfect" DAC. Thus the accuracy specification includes the worst case effects of all of the normally published errors such as non-linearity, zero drift, full scale drift, etc.



The device is exceptionally versatile, since it may be used in a voltage or current output mode, and may be offset to produce bipolar operation. Matched auxillary resistors are provided for amplifier feedback or current summing. Provisions are also made for scale factor adjustment and for cascading of additional D/A converters for extended resolution.

PRELIMINARY HI-562

12 Bit High Speed Monolithic Digital-to-Analog Converter

FEATURES

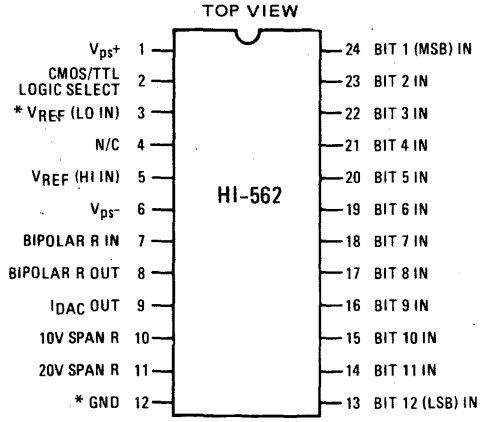
- MONOLITHIC CONSTRUCTION
- EXTREMELY FAST SETTLING — 200ns TO 0.01% (TYP.)
- LOW GAIN DRIFT — ±2ppm/°C (MAX.)
- EXCELLENT LINEARITY OVER TEMPERATURE — ±1/2 LSB (MAX.)
- DESIGNED FOR MINIMUM GLITCHES
- MONOTONIC OVER TEMPERATURE

APPLICATIONS

- CRT DISPLAY GENERATION
- HIGH SPEED A/D CONVERTERS
- VIDEO SIGNAL RECONSTRUCTION
- WAVEFORM SYNTHESIZERS
- HIGH SPEED DATA ACQUISITION
- HIGH-REL APPLICATIONS
- PRECISION INSTRUMENTS

DESCRIPTION

The Harris HI-562 is the first monolithic digital-to-analog converter to combine both ultra-high speed performance and true 12-bit accuracy on the same chip. The HI-562's fast output current settling of 200ns to 0.01% is achieved using dielectric isolation processing to reduce internal parasitics for fast rise and fall times during switching. Output glitches are minimized in the HI-562 by incorporating equally weighted current sources switched into an R-2R ladder network for symmetrical turn-ON and turn-OFF switching times. This creates within the chip a very uniform and constant thermal distribution for excellent linearity and also completely eliminates thermal transients during switching. High stability thin film resistor processing together with laser trimming provide the HI-562 with guaranteed true 12-bit linearity to within ±1/2 LSB maximum over the -55°C to +125°C temperature range. Beyond that, the HI-562's low offset and gain drift over this temperature range assure that its absolute accuracy when referred to a fixed 10V reference will not deviate more than ±3/2 LSB for unipolar mode operation (±2 LSB for bipolar operation). The input reference can be varied from +2V to +10V for two quadrant multiplying mode operation.



The HI-562 is recommended as a replacement for higher cost hybrid and modular units for increased reliability and accuracy in applications such as CRT displays, precision instruments and data acquisition systems requiring throughput rates as high as 5MHz for full range transitions. Its small size makes it an ideal choice as the heart of high speed A/D converter designs or as a building block in high speed or high resolution industrial process control systems. The HI-562 is also ideally suited for aircraft and space instrumentation where operation over a wide temperature range is required.

The HI-562-5 is specified for operation over 0°C to +70°C, the HI-562-4 over -25°C to +85°C and the HI-562-2 and HI-562-8 over -55°C to +125°C. Processing to MIL-STD-883A Class B screening is available by selecting the HI-562-8. All are available in a hermetically sealed 24-lead dual-in-line package.

NOTES

1. Absolute maximum ratings are limiting values, applied individually, beyond which the serviceability of the circuit may be impaired. Functional operation under any of these conditions is not necessarily implied.
2. $V_{ps}+$ tolerance is ±10% for HI-562-2, -8. and ±5% for HI-562-4, -5.
3. See Definitions.
4. FSR is "full scale range" and is 20V for ±10V range, 10V for ±5V range, etc.; or 5mA(±20%) for current output.
5. After 30 seconds warm-up.
6. Using an external op amp with internal span resistors and specified external trim resistors in place of potentiometers R_1 and R_2. Errors are adjustable to zero using R_1 and R_2 potentiometers. (See Operating Instructions Figure 2.)
7. Maximum $V_{ps}+$ is +12V for high level logic only, i.e. when pin 1 is tied to pin 2.

DEFINITIONS OF SPECIFICATIONS

DIGITAL INPUTS

The HI-562 accepts digital input codes in binary format and may be user connected for any one of three binary codes. Straight Binary, Two's Complement, or Offset Binary, (See Operating Instructions).

DIGITAL INPUT	ANALOG OUTPUT		
	Straight Binary	Offset Binary	Two's Complement*
MSB LSB			
000...000	Zero	-FS (Full Scale)	Zero
100...000	½FS	Zero	-FS
111...111	+FS – 1 LSB	+FS – 1 LSB	½FS – 1 LSB
011...111	½FS – 1 LSB	Zero – 1 LSB	+FS – 1 LSB
*Invert MSB with external inverter to obtain Two's Complement Coding			

ACCURACY

NONLINEARITY – Nonlinearity of a D/A converter is an important measure of its accuracy. It describes the deviation from an ideal straight line transfer curve drawn between zero (all bits OFF) and full scale (all bits ON).

DIFFERENTIAL NONLINEARITY – For a D/A converter, it is the difference between the actual output voltage change and the ideal (1 LSB) voltage change for a one bit change in code. A Differential Nonlinearity of ±1 LSB or less guarantees monotonictiy; i.e., the output always increases and never decreases for an increasing input.

SETTLING TIME

Settling time is the time required for the output to settle to within the specified error band for any input code transition. It is usually specified for a full scale or major carry transition.

DRIFT

GAIN DRIFT – The change in full scale analog output over the specified temperature range expressed in parts per million of full scale range per °C (ppm of FSR/°C). Gain error is measured with respect to +25°C at high (T_H) and low (T_L) temperatures. Gain drift is calculated for both high (T_H -25°C) and low ranges (+25°C -T_L) by dividing the gain error by the respective change in temperature. The specification is the larger of the two representing worst case drift.

OFFSET DRIFT – The change in analog output with all bits OFF over the specified temperature range expressed in parts per million of full scale range per °C (ppm of FSR/°C). Offset error is measured with respect to +25°C at high (T_H) and low (T_L) temperatures. Offset Drift is calculated for both high (T_H -25°C) and low (+25°C -T_L) ranges by dividing the offset error by the respective change in temperature. The specification given is the larger of the two, representing worst-case drift.

POWER SUPPLY SENSITIVITY

Power Supply Sensitivity is a measure of the change in gain and offset of the D/A converter resulting from a change in -15V, +5V or +15V supplies. It is specified under DC conditions and expressed as parts per million of full scale range per percent of change in power supply (ppm of FSR/%).

COMPLIANCE

Compliance voltage is the maximum output voltage range that can be tolerated and still maintain its specified accuracy. Compliance limit implies functional operation only and makes no claims to accuracy.

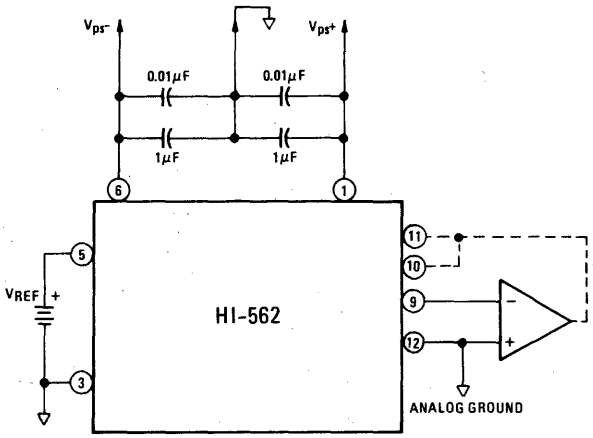
GLITCH

A glitch on the output of a D/A converter is a large transient spike resulting from unequal internal ON-OFF switching times. Worst case glitches usually occur at half-scale or the major carry code transition from 011...1 to 100...0 or vice versa. For example, if turn ON is greater than turn OFF for 011...1 to 100...0, an intermediate state of 000...0 exists, such that, the output momentarily glitches to zero output. Matched switching times and fast switching will reduce glitches considerably.

©IC MASTER 1979

DECOUPLING AND GROUNDING

For best accuracy and high frequency performance, the grounding and decoupling scheme shown in Figure 1 should be used. Decoupling capacitors should be connected close to the HI-562 (Preferrably to the device pins) and should be tantalum or electrolytic bypassed with ceramic types for best high frequency noise rejection.



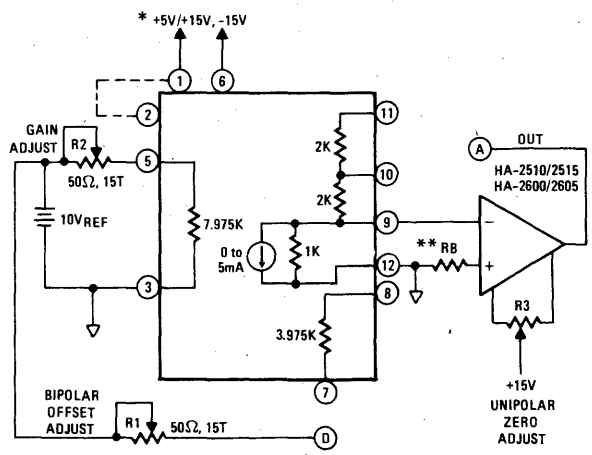


Figure 1

UNIPOLAR AND BIPOLAR VOLTAGE OUTPUT CONNECTIONS

CONNECTIONS – Using an external resistive load, the output compliance should not exceed ±1V to maintain specified accuracy. For higher output voltages, accuracy can be maintained by using an external op amp and the internal span resistors as shown in Figure 2 and defined in Table 1 for unipolar and bipolar modes.

* For TTL and DTL compatibility, connect +5V to pin 1 and leave pin 2 open. For CMOS compatibility, connect digital power supply ($+4.85V \leq V_{DD} \leq +12V$) to pin 1 and short pin 2 to pin 1.

** Bias resistor, RB, should be chosen to equalize op amp offset voltage due to bias current. Its value is calculated from the parallel combination of the current source output resistance (1K) and the op amp feedback resistor. See Table 1 for values of RB.

Figure 2

Table 1

	OUTPUT RANGE	CONNECTIONS Pin 7 to	Pin 8 to	Pin 10 to	Pin 11 to	BIAS (R_B) RESISTOR
Unipolar Mode	0 to +10V	N.C.	N.C.	A	N.C.	667Ω
	0 to +5V	N.C.	N.C.	A	9	500Ω
Bipolar Mode	±10V	D	9	N.C.	A	667Ω
	±5V	D	9	A	N.C.	580Ω
	±2.5V	D	9	A	9	444Ω

EXTERNAL GAIN AND ZERO CALIBRATION (See Figure 2)

The input reference resistor (7.975K) and bipolar offset resistors shown in Figure 2 are both intentionally set low by 25Ω to allow the user to externally trim-out initial errors to a very high degree of precision. The adjustments are made in the voltage output mode using an external op amp as current-to-voltage converter and the HI-562 internal scaling resistors as feedback elements for optimum accuracy and temperature coefficient. For best accuracy over temperature, select an op amp that has good front-end temperature coefficients such as the HA-2600/2605 with offset voltage and offset current tempco's of 5μV/°C and 1nA/°C, respectively. For high speed voltage mode applications where fast settling is required, the HA-2510/2515 is recommended for better than 1.5μs settling to 0.01%. Using either one, potentiometer R_3 conveniently nulls unipolar offset plus op amp offset in one operation (for HA-2510/2515 and HA-2600/2605 use R_3 = 20K and 100K, respectively). For bipolar mode operation, R_3 should be used to null op amp offset to optimize its tempco (i.e., short 9 to A and adjust R_3 for zero before calibrating in bipolar mode). The gain and bipolar offset adjustment range using 50Ω potentiometers is ±12 LSB and ±25 LSB respectively. If desired, the potentiometers can be replaced with fixed 24.9 Ω (1%) resistors resulting in an initial gain and bipolar offset accuracy of typically ±1/2 LSB.

UNIPOLAR CALIBRATION

Step 1: Unipolar Offset
- Turn all bits OFF
- Adjust R3 for zero volts output

Step 2: Gain
- Turn all bits ON
- Adjust R2 for an output of FS -1 LSB
  That is, adjust for:
  9.9976V for 0V to +10V range
  4.9988V for 0V to +5V range

BIPOLAR CALIBRATION

Step 1: Bipolar Offset
- Turn all bits OFF
- Adjust R1 for an output of:
  -10V for ±10V range
  -5V for ±5V range
  -2.5V for ±2.5V range

Step 2: Gain
- Turn bit 1 (MSB) ON; all other bits OFF
- Adjust R2 for zero volts output

Preliminary

HI-5612

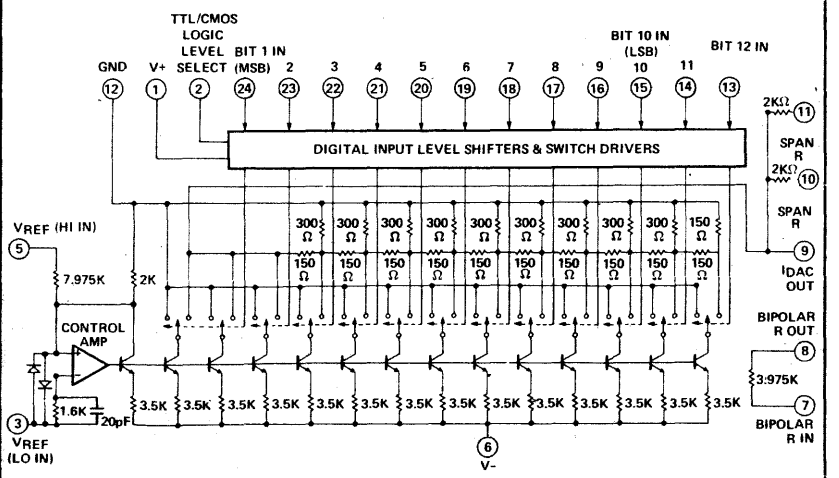
12 Bit High Speed Monolithic Digital-to-Analog Converter

FEATURES

- MONOLITHIC CONSTRUCTION
- EXTREMELY FAST SETTLING. . . . . .150ns TO ½LSB TYP.
- LOW GAIN DRIFT. . . . . .±5ppm/°C TYP.
- EXCELLENT LINEARITY OVER TEMPERATURE . . . . . .± ½LSB MAX.
- DESIGNED FOR MINIMUM GLITCHES
- MONOTONIC OVER TEMPERATURE

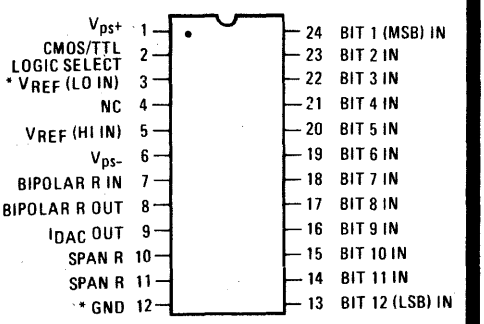
APPLICATIONS

- CRT DISPLAY GENERATION
- HIGH SPEED A/D CONVERTERS
- VIDEO SIGNAL RECONSTRUCTION
- WAVEFORM SYNTHESIZERS
- HIGH SPEED DATA ACQUISITION
- HIGH RELIABILITY APPLICATIONS
- PRECISION INSTRUMENTS



DESCRIPTION

The HI-5612 is an ultra-high speed 12 bit monolithic current output digital-to-analog converter. The fast output current settling of 150ns to ½LSB of its final value is achieved using dielectric isolation processing to reduce internal parasitics for fast rise and fall times during switching. Output glitches are minimized in the HI-5612 by incorporating equally weighted current sources switched into an R-2R ladder network for symmetrical turn-on and turn-off switching times. This creates within the chip a very uniform and constant thermal distribution for excellent linearity and also eliminates thermal transients during switching. High stability thin film resistor processing, together with laser trimming provide the HI-5612 with true 12 bit linearity to within ± ½LSB maximum over operating temperature range. The HI-5612's low offset and gain drift over the operating temperature range assures that its absolute accuracy when referred to a fixed 10V reference will not deviate more than ± 2LSB for both unipolar and bipolar operation.



The HI-5612 is recommended as a replacement for high cost hybrid and modular units for increased reliability and accuracy in applications such as CRT Displays, precision instruments and data acquisition system requiring through-put rates as high as 7mHz for full range transitions. Its small size makes it an ideal choice as the essential part of high speed A/D converter designs or as a building block in high speed or high resolution industrial process control systems. The HI-5612 is also ideally suited for aircraft and space instrumentation where operation over a wide temperature range is required.

The HI-5612-5 is specified for operation over 0°C to +75°C, the HI-5612-2 and HI-5612-8 over -55°C to +125°C. Processing to MIL-STD-883A class B screening is available by selecting the HI-5612-8. All are available in a hermetically sealed 24 lead dual-in-line package.

NOTES

1. Absolute maximum ratings are limiting values, applied individually, beyond which the serviceability of the circuit may be impaired. Functional operation under any of these conditions is not necessarily implied.
2. The HI-5612 accepts digital input codes in binary format and may be user connected for any one of three binary codes. Straight binary, offset binary, or two's complement binary. (See operating instructions)
3. For TTL and DTL compatibility connect +5V to pin 1 and ground pin 2. The $V_{ps}+$ tolerance is $\pm$10% for HI-5612-2, -8. And $\pm$ 5% for HI-5612-5.
4. For CMOS compatibility connect digital power supply ($+4.5V \leq V_{DD} \leq +10V$) to pin 1 and short pin 2 to pin 1.
5. See definitions.
6. Using an external op amp with internal span resistors and 24.9Ω $\pm$ 1% external trim resistors in place of potentiometers R1 and R2. These errors are adjustable to zero using R1 and R2. (See operating instructions)
7. Using an external op amp and internal span resistors. (See operating instructions for connections)
8. Specified for digital input in all '1's or all '0's.
9. FSR is "Full Scale Range" and is 10V for $\pm$ 5V range, 5V for $\pm$ 2.5V range, etc., or 5mA ($\pm$ 20%) for current output.
10. After 30 seconds warm-up.

DEFINITIONS OF SPECIFICATIONS

ACCURACY

NONLINEARITY - Nonlinearity of a D/A converter is an important measure of its accuracy. It describes the deviation from an ideal straight line transfer curve drawn between zero (all bits OFF) and full scale (all bits ON).

DIFFERENTIAL NONLINEARITY - For a D/A converter, it is the difference between the actual output voltage change and the ideal (1LSB) voltage change for a one bit change in code. A Differential Nonlinearity of $\pm$ 1LSB or less guarantees monotonicitiy; i.e., the output always increases and never decreases for and increasing input.

SETTLING TIME

Settling time is the time required for the output to settle to within the specified error band for any input code transition. It is usually specified for a full scale or major carry transition (01.....1 to 10.....0 or vice versa)

DRIFT

GAIN DRIFT - The change in full scale analog output over the specified temperature range expressed in parts per million of full scale range per ^{o}C (ppm of FSR/^{o}C). Gain error is measured with respect to +25^{o}C at high (T_H) and low (T_L) temperatures. Gain drift is calculated for both high (T_H -25^{o}C) and low ranges (+25^{o}C - T_L) by dividing the gain error by the respective change in temperature. The specification is the larger of the two representing worst case drift.

OFFSET DRIFT - The change in analog output with all bits OFF over the specified temperature range expressed in parts per million of full scale range per ^{o}C (ppm of FSR/^{o}C). Offset error is measured with respect to +25^{o}C at high (T_H) and low (T_L) temperatures. Offset Drift is calculated for both high (T_H -25^{o}C) and low (+25^{o}C -T_L) ranges by dividing the offset error by the respective change in temperature. The specification given is the larger of the two, representing worst case drift.

POWER SUPPLY SENSITIVITY

Power Supply Sensitivity is a measure of the change in gain and offset of the D/A converter resulting from a change in -15V, +5V or +15V supplies. It is specified under DC conditions and expressed as parts per million of full scale range per percent of change in power supply (ppm of FSR/%).

COMPLIANCE

Compliance voltage is the maximum output voltage range that can be tolerated and still maintain its specified accuracy. Compliance limit implies functional operation only and makes no claims to accuracy.

GLITCH

A glitch on the output of a D/A converter is a large transient spike resulting from unequal internal ON-OFF switching times. Worst case glitches usually occur at half-scale or the major carry code transition from 011.....1 to 100.....0 or vice versa. For example, if turn ON is greater than turn OFF for 011.....1 to 100.....0, an intermediate state of 000.....0 exists, such that, the output momentarily glitches to zero output. Matched switching times and fast switching will reduce glitches considerably.

OPERATING INSTRUCTIONS

DECOUPLING AND GROUNDING

For best accuracy and high speed performance, the grounding and decoupling scheme shown in Figure 1 should be used. Decoupling capacitors should be connected close to the HI-5612 (preferrably to the device pin) and should be tantalum or electrolytic bypassed with ceramic types for best high frequency noise rejection.

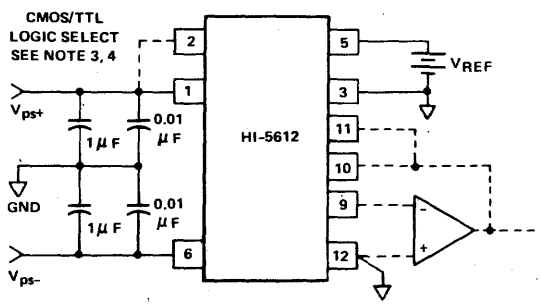

FIGURE 1

©IC MASTER 1979

HIGH PERCISION PERFORMANCE

The output accuracy of the HI-5612 depends mainly on the accuracy of the voltage applied to the VREF input of HI-5612 and it can be described roughly as VREF/8KΩ = ¼ full scale output current. This means the output of HI-5612 will change whenever VREF varies. For high precision performance a precision +10V voltage reference with reasonably low temperature coefficient such as HA-1600 is highly recommended. For voltage output operation use an external op amp as current-to-voltage converter and the HI-5612 internal scaling resistors as feedback elements for optimum accuracy and temperature coefficient. The selected op amp should have a good front-end temperature coefficient such as HA-2600/2605 with offset voltage and offset current tempco's of 5 μ V/°C and 1nA/°C, respectively. The input reference resistor (7.975KΩ) and bipolar offset resistor (3.975K Ω) are both intentionally set low by 25 Ω to allow the user to externally trim-out initial errors to a very high degree of precision. For high speed voltage output applications where fast settling is required, the HA-2510/2515 is recommended for better than 1.2 μ s settling to ½LSB.

UNIPOLAR VOLTAGE OUTPUT CONNECTIONS AND CALIBRATION

The connections for unipolar +10V and +5V voltage output using an external op amp and the internal span resistors are shown in Figure 2 and Figure 3, respectively.

CALIBRATION - UNIPOLAR

Step 1 Offset
- Turn all bits off (all 0's)
- Adjust R3 for zero volts output

Step 2 Gain
- Turn all bits on (all 1's)
- Adjust R1 for an output of FS-1LSB
- That is, adjust for:
- 9.99756V for 0V to +10V range
- 4.99878V for 0V to +5V range

UNIPOLAR - STRAIGHT BINARY
0V TO +10V OUTPUT RANGE

DIGITAL INPUT	ANALOG OUTPUT	
11 1	FS - 1LSB	= 9.99756V
10 0	½FS	= 5.00000V
01 1	½FS -1LSB	= 4.99756V
00 0	Zero	= 0.00000V

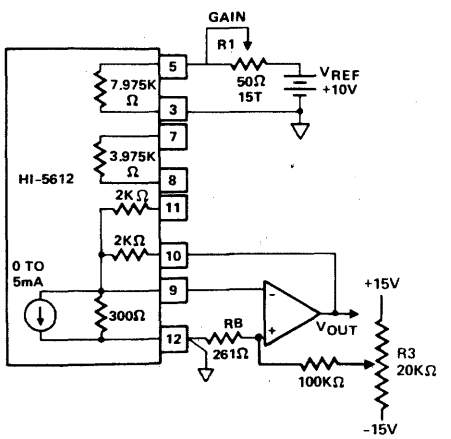

FIGURE 2

01 1	½FS -1LSB	= 2.49878V
00 0	Zero	= 0.00000V

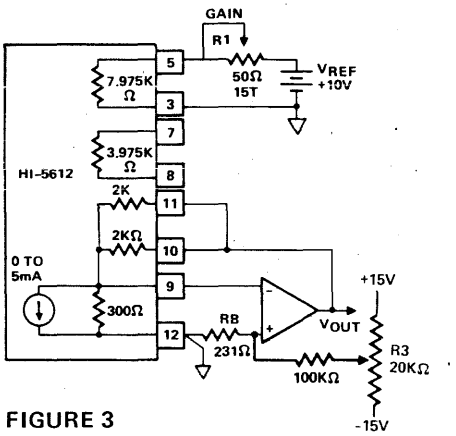

FIGURE 3

BIPOLAR VOLTAGE OUTPUT CONNECTIONS AND CALIBRATION

The connections for Bipolar ± 5V and ± 2.5V voltage output using an external op amp and the internal span resistors are shown in Figure 4 and Figure 5, respectively.

CALIBRATION - BIPOLAR

Step 1 Op Amp Null
- Short op amp output to op amp -input
- Adjust R3 for zero volts output

Step 2 Gain
- Turn all bits on (all 1's) record output voltage
- Turn all bits off (all 0's) record output voltage
- Adjust R1 till the difference between the readings is equal to:
  9.99756V for ± 5V range
  4.99878V for ±2.5V range

Step 3 Offset
- Turn bit 1 (MSB) on, all other bits off (10....0)
- Adjust R2 for zero volts output

Preliminary

HI-5610

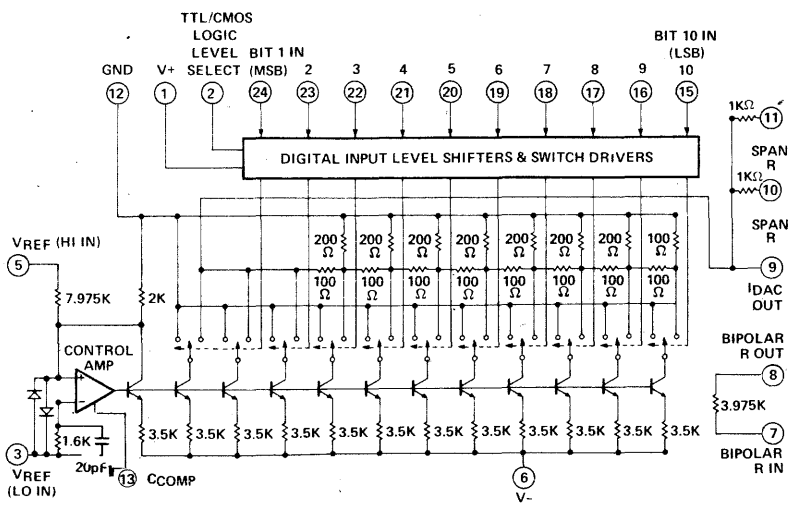
10 Bit High Speed Monolithic Digital-to-Analog Converter

FEATURES

- MONOLITHIC CONSTRUCTION
- EXTREMELY FAST SETTLING. . . . . 85ns TO ½LSB TYP.
- LOW GAIN DRIFT. . . . . ±5ppm/°C TYP.
- EXCELLENT LINEARITY OVER TEMPERATURE . . . . . ±½LSB MAX.
- DESIGNED FOR MINIMUM GLITCHES
- MONOTONIC OVER TEMPERATURE

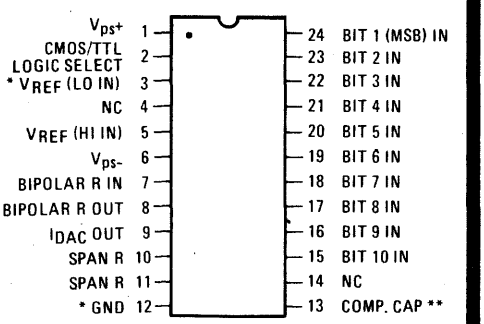
APPLICATIONS

- CRT DISPLAY GENERATION
- HIGH SPEED A/D CONVERTERS
- VIDEO SIGNAL RECONSTRUCTION
- WAVEFORM SYNTHESIZERS
- HIGH SPEED DATA ACQUISITION
- HIGH RELIABILITY APPLICATIONS
- PRECISION INSTRUMENTS



DESCRIPTION

The HI-5610 is an ultra-high speed 10 bit monolithic current output digital-to-analog converter. The fast output current settling of 85ns to ½LSB of its final value is achieved using dielectric isolation processing to reduce internal parasitics for fast rise and fall times during switching. Output glitches are minimized in the HI-5610 by incorporating equally weighted current sources switched into an R-2R ladder network for symmetrical turn-on and turn-off switching times. This creates within the chip a very uniform and constant thermal distribution for excellent linearity and also eliminates thermal transients during switching. High stability thin film resistor processing, together with laser trimming provide the HI-5610 with true 10 bit linearity to within ± ½LSB maximum over operating temperature range. The HI-5610's low offset and gain drift over the operating temperature range assures that its absolute accuracy when referred to a fixed 10V reference will not deviate more than ±1LSB for both unipolar and bipolar operation.



The HI-5610 is recommended as a replacement for high cost hybrid and modular units for increased reliability and accuracy in applications such as CRT Displays, precision instruments and data acquisition system requiring through-put rates as high as 12mHz for full range transitions. Its small size makes it an ideal choice as the essential part of high speed A/D converter designs or as a building block in high speed or high resolution industrial process control systems. The HI-5610 is also ideally suited for aircraft and space instrumentation where operation over a wide temperature range is required.

The HI-5610-5 is specified for operation over 0°C to +75°C, the HI-5610-2 and HI-5610-8 over -55°C to +125°C. Processing to MIL-STD-883A class B screening is available by selecting the HI-5610-8. All are available in a hermetically sealed 24 lead dual-in-line package.

FUNCTIONAL DIAGRAM

PINOUT

* Pin 3 connected to bottom case for high frequency shielding.

** For high speed operation, connect 0.01μF between Pin 13 and GND. Otherwise, leave Pin 13 open.

NOTES

1. Absolute maximum ratings are limiting values, applied individually, beyond which the serviceability of the circuit may be impaired. Functional operation under any of these conditions is not necessarily implied.
2. The HI-5610 accepts digital input codes in binary format and may be user connected for any one of three binary codes. Straight binary, offset binary, or two's complement binary. (See operating instructions)
3. For TTL and DTL compatibility connect +5V to pin 1 and ground pin 2. The $V_{ps}+$ tolerance is ±10% for HI-5610-2, -8. And ± 5% for HI-5610-5.
4. For CMOS compatibility connect digital power supply ($+4.5V \leq V_{DD} \leq +10V$) to pin 1 and short pin 2 to pin 1.
5. See definitions.
6. Using an external op amp with internal span resistors and 24.9Ω ± 1% external trim resistors in place of potentiometers R1 and R2. These errors are adjustable to zero using R1 and R2. (See operating instructions)
7. Using an external op amp and internal span resistors. (See operating instructions for connections)
8. Specified for digital input in all '1's or all '0's.
9. FSR is "Full Scale Range" and is 5V for ± 2.5V range, 2.5V for ± 1.25V range, etc., or 5mA (± 20%) for current output.
10. After 30 seconds warm-up.

DEFINITIONS OF SPECIFICATIONS

ACCURACY

NONLINEARITY - Nonlinearity of a D/A converter is an important measure of its accuracy. It describes the deviation from an ideal straight line transfer curve drawn between zero (all bits OFF) and full scale (all bits ON).

DIFFERENTIAL NONLINEARITY - For a D/A converter, it is the difference between the actual output voltage change and the ideal (1LSB) voltage change for a one bit change in code. A Differential Nonlinearity of ± 1LSB or less guarantees monotonicitiy; i.e., the output always increases and never decreases for and increasing input.

SETTLING TIME

Settling time is the time required for the output to settle to within the specified error band for any input code transition. It is usually specified for a full scale or major carry transition (01.....1 to 10.....0 or vice versa)

DRIFT

GAIN DRIFT - The change in full scale analog output over the specified temperature range expressed in parts per million of full scale range per °C (ppm of FSR/°C). Gain error is measured with respect to +25°C at high (T_H) and low (T_L) temperatures. Gain drift is calculated for both high (T_H -25°C) and low ranges (+25°C - T_L) by dividing the gain error by the respective change in temperature. The specification is the larger of the two representing worst case drift.

OFFSET DRIFT - The change in analog output with all bits OFF over the specified temperature range expressed in parts per million of full scale range per °C (ppm of FSR/°C). Offset error is measured with respect to +25°C at high (T_H) and low (T_L) temperatures. Offset Drift is calculated for both high (T_H -25°C) and low (+25°C -T_L) ranges by dividing the offset error by the respective change in temperature. The specification given is the larger of the two, representing worst case drift.

POWER SUPPLY SENSITIVITY

Power Supply Sensitivity is a measure of the change in gain and offset of the D/A converter resulting from a change in -15V, +5V or +15V supplies. It is specified under DC conditions and expressed as parts per million of full scale range per percent of change in power supply (ppm of FSR/%).

COMPLIANCE

Compliance voltage is the maximum output voltage range that can be tolerated and still maintain its specified accuracy. Compliance limit implies functional operation only and makes no claims to accuracy.

GLITCH

A glitch on the output of a D/A converter is a large transient spike resulting from unequal internal ON-OFF switching times. Worst case glitches usually occur at half-scale or the major carry code transition from 011.....1 to 100.....0 or vice versa. For example, if turn ON is greater than turn OFF for 011.....1 to 100.....0, an intermediate state of 000.....0 exists, such that, the output momentarily glitches to zero output. Matched switching times and fast switching will reduce glitches considerably.

OPERATING INSTRUCTIONS

DECOUPLING AND GROUNDING

For best accuracy and high speed performance, the grounding and decoupling scheme shown in Figure 1 should be used. Decoupling capacitors should be connected close to the HI-5610 (preferrably to the device pin) and should be tantalum or electrolytic bypassed with ceramic types for best high frequency noise rejection.

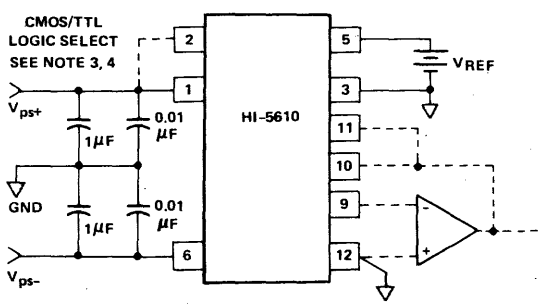

FIGURE 1

©IC MASTER 1979

HIGH PERCISION PERFORMANCE

The output accuracy of the HI-5610 depends mainly on the accuracy of the voltage applied to the VREF input of HI-5610 and it can be described roughly as VREF/8KΩ = ¼ full scale output current. This means the output of HI-5610 will change whenever VREF varies. For high precision performance a precision +10V voltage reference with reasonably low temperature coefficient such as HA-1600 is highly recommended. For voltage output operation use an external op amp as current-to-voltage converter and the HI-5610 internal scaling resistors as feedback elements for optimum accuracy and temperature coefficient. The selected op amp should have a good front-end temperature coefficient such as HA-2600/2605 with offset voltage and offset current tempco's of 5 μV/°C and 1nA/°C, respectively. The input reference resistor (7.975K Ω) and bipolar offset resistor (3.975K Ω) are both intentionally set low by 25 Ω to allow the user to externally trim-out initial errors to a very high degree of precision. For high speed voltage output applications where fast settling is required, the HA-2510/2515 is recommended for better than 1 μs settling to ½LSB.

UNIPOLAR VOLTAGE OUTPUT CONNECTIONS AND CALIBRATION

The connections for unipolar +5V and +2.5V voltage output using an external op amp and the internal span resistors are shown in Figure 2 and Figure 3, respectively.

CALIBRATION - UNIPOLAR

Step 1 Offset
- Turn all bits off (all 0's)
- Adjust R3 for zero volts output

Step 2 Gain
- Turn all bits on (all 1's)
- Adjust R1 for an output of FS-1LSB
  That is, adjust for:
  4.99512V for 0V to +5V range
  2.49756V for 0V to +2.5V range

UNIPOLAR - STRAIGHT BINARY
0V TO +5V OUTPUT RANGE

DIGITAL INPUT	ANALOG OUTPUT	
11 1	FS - 1LSB	= 4.99512V
10 0	½FS	= 2.50000V
01 1	½FS -1LSB	= 2.49512V
00 0	Zero	= 0.00000V

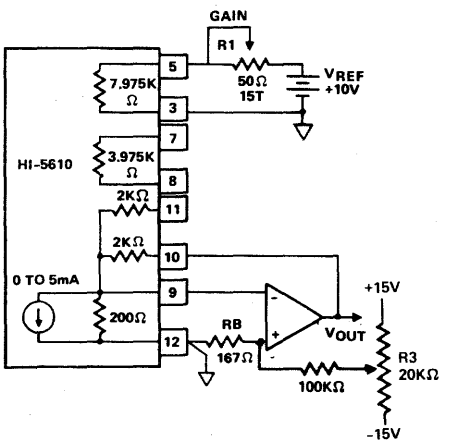

FIGURE 2

UNIPOLAR - STRAIGHT BINARY
0V TO +2.5V OUTPUT RANGE

DIGITAL INPUT	ANALOG OUTPUT	
11 1	FS - 1LSB	= 2.49756V
10 0	½FS	= 1.25000V
01 1	½FS -1LSB	= 1.24756V
00 0	Zero	= 0.00000V

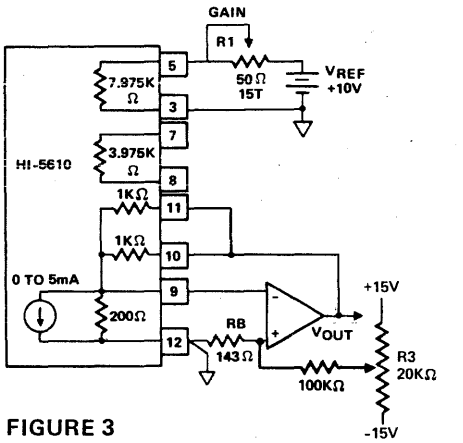

FIGURE 3

BIPOLAR VOLTAGE OUTPUT CONNECTIONS AND CALIBRATION

The connections for Bipolar ± 2.5V and ± 1.25V voltage output using an external op amp and the internal span resistors are shown in Figure 4 and Figure 5, respectively.

CALIBRATION - BIPOLAR

Step 1 Op Amp Null
- Short op amp output to op amp -input
- Adjust R3 for zero volts output

Step 2 Gain
- Turn all bits on (all 1's) record output voltage
- Turn all bits off (all 0's) record output voltage
- Adjust R1 till the difference between the readings is equal to:
  4.99512V for ± 2.5V range
  2.49756V for ±1.25V range.

Step 3 Offset
- Turn bit 1 (MSB) on, all other bits off (10....0)
- Adjust R2 for zero volts output

DESCRIPTION

The HI-5608 is an ultra-high speed 8-bit monolithic current output digital-to-analog converter. The fast output current settling of 45ns to ½ LSB of its final value is achieved using dielectric isolation processing to reduce internal parasitics for fast rise and fall times during switching. Output glitches are minimized in the HI-5608 by incorporating equally weighted current sources switched into an R-2R ladder network for symetrical turn-on and turn-off switching times. This creates within the chip a very uniform and constant thermal distribution for excellent linearity and also eliminates thermal transients during switching. High stability thin film resistor processing, together with laser trimming provide the HI-5608 with guaranteed true 8-bit linearity to within ± ¼ LSB maximum over operating temperature range. The HI-5608's low offset and gain drift over the operating temperature range assures that its absolute accuracy when referred to a fixed 10V reference will not deviate more than ± 3/8 LSB for both unipolar and bipolar operation.

The HI-5608 is recommended as a replacement for high cost hybrid and modular units for increased reliability and accuracy in applications such as CRT display, and data acquisition systems requiring through-put rates as high as 20MHz for full range transitions. Its small size makes it an ideal choice as the essential part of high speed A/D converter designs or as a building block in high speed industrial process control systems. The HI-5608 is also ideally suited for aircraft and space instrumentation where operation over a wide temperature range is required.

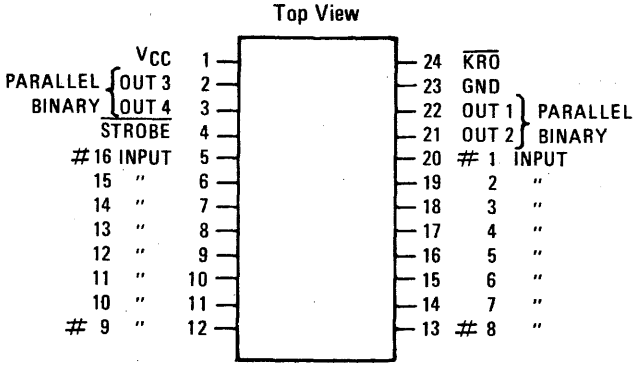
HD-0165
Keyboard Encoder

FEATURES

- STROBE OUTPUT
- KEY ROLLOVER OUTPUT
- EXPANDABLE: 2 PACKAGES REQUIRED FOR FULL TELETYPEWRITER, EIGHT-BIT ENCODING
- SINGLE +5.0V SUPPLY REQUIRED
- DTL/TTL OUTPUTS
- MONOLITHIC RELIABILITY

APPLICATIONS

- MICROPROCESSOR DATA ENTRY (16 KEY TO HEX CODE)
- BCD DATA ENTRY
- TYPEWRITER TYPE KEYBOARDS
- CONTROL PANELS



DESCRIPTION

The HD-0165 Keyboard Encoder is a 16 line to four-bit parallel encoder intended for use with manual data entry devices such as calculator or typewriter keyboards. In addition to the encoding function, there is a Strobe output and a Key Rollover output which energizes whenever two or more inputs are energized simultaneously. Any four-bit code can be implemented by proper wiring of the input lines. Inputs are normally wired through the key switches to the +5.0V power supply. Full typewriter keyboard encoding up to eight bits can be accomplished with two Encoder circuits by the use of double pole key switches or single pole switches with two isolation diodes per key. Outputs will interface with all popular DTL and TTL logic families. The circuit is packaged in a hermetic 24-pin dual-in-line package and operates over the temperature range of 0°C to +75°C.

CMOS THREE-STATE LATCHING BUS DRIVER

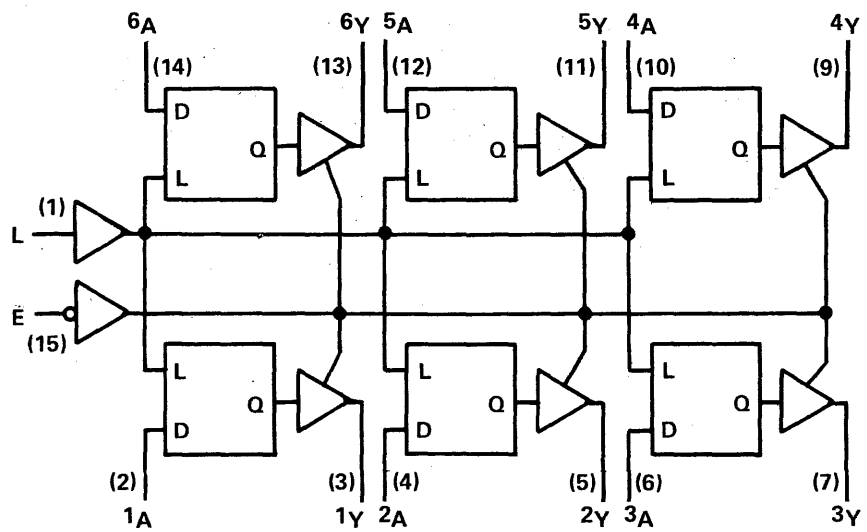
Features

- SINGLE POWER SUPPLY
- HIGH NOISE IMMUNITY
- INDUSTRIAL AND MILITARY GRADES
- DRIVE CAPACITY. 300pF
- SOURCE CURRENT. 4mA
- SINK CURRENT 6mA
- PROPAGATION DELAY . . . . . 65nsec @ 5V

Pinout

TOP VIEW

Description



The HD-6431 is a self-aligned silicon gate CMOS Latching Three-State Bus Driver. This circuit consists of 6 non-inverting latching drivers with separate input and output. A high on the strobe line L allows data to go through the latches and a transition to low latches the data. A high on the Three-State control $\overline{E}$ forces the buffers to the high impedance mode without disturbing the latched data. New data may be latched in while the buffers are in the high impedance mode.

Truth Table

CONTROL INPUTS		DATA PORT STATUS	
$\overline{E}$	L	A	Y
H	L	X	HI-Z*
H	H	X	HI-Z
L	↓	X	*
L	H	L	L
L	H	H	H

* Data is latched to the value of the last input
X = Don't Care
HI-Z = High Impedance
↓ = Transition from High to Low level

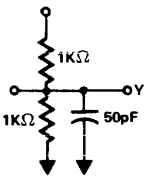
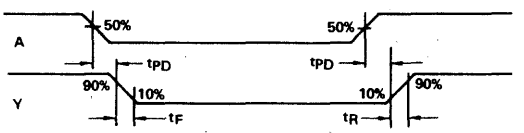
Switching Waveforms



All inputs have t_R, $t_F \leq$ 20ns.

OUTPUT TEST CIRCUIT
FOR PROPAGATION DELAYS



OUTPUT TEST CIRCUIT
FOR THREE-STATE DELAYS

DECOUPLING CAPACITORS

The transient current required to charge the load capacitance is given by $I_T = C\frac{dv}{dt}$. Assuming that all outputs may change state at the same time and that $\frac{dv}{dt}$ is constant; $I_T = \left(\Sigma C_L\right)\left(\frac{V_{CC} \times 80\%}{t_R \text{ or } t_F}\right)$ eg. [t_R = 80ns, V_{CC} = 5.0V, each C_L = 300pF, $I_T = (4)\left(300 \times 10^{-12}\right)\frac{5.0 \times 0.8}{80 \times 10^{-9}} = 90\text{mA.}$] This current spike may cause a large negative voltage spike on V_{CC}, which if it becomes a diode drop less than any input, may cause the device to latch up. It is recommended that a 0.1 μF ceramic disk decoupling capacitor be placed between V_{CC} and GND at each device to filter out this noise.

PROPAGATION DELAYS

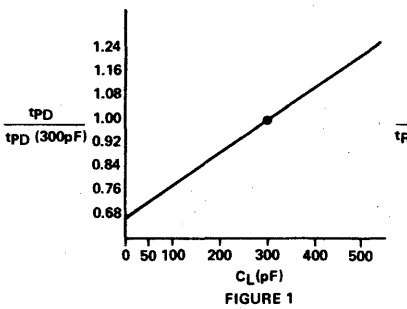


FIGURE 1

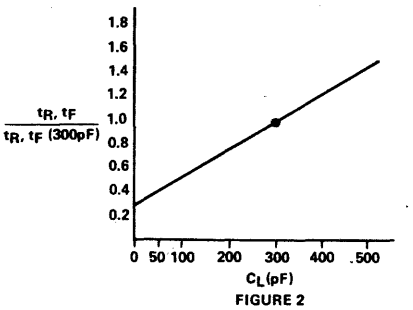

FIGURE 2

The above example will illustrate the calculation of a more useful propagation delay. The system in this example uses a 5 volt supply with a tolerance of ±10%, an ambient temperature of as high as 125°C, and a calculated load capacitance of 150pF. This application requires the HD-6431-2. The table of A.C. specs shows that t_{PD} at 4.5V and 125°C is 75nsec. Use the graph in Figure 1 to get the degradation multiple for 150pF. The number shown is 0.84. The adjusted propagation delay, to the 10% or 90% point, is therefore 75 x 0.84 or 63nsec. To obtain the rise and fall times check the A.C. specs for the rise and fall times at 4.5V and 125°C to obtain a worst case rise time of 90nsec. Use Figure 2 to find it's degradation multiple to be 0.65. The adjusted rise time is, therefore, 90 x 0.65 or 58nsec. To obtain the standard 50% to 50% propagation delay, add the adjusted propagation delay to half of the adjusted rise time to get a propagation delay of 92nsec. The rise time was used here because it is always the worst case.

The above example will illustrate the calculation of a more useful propagation delay. The system in this example uses a 5 volt supply with a tolerance of ±10%, an ambient temperature of as high as 125°C, and a calculated load capacitance of 150pF. This application requires the HD-6433-2. The table of A.C. specs shows that t_{PD} at 4.5V and 125°C is 50nsec. Use the graph in Figure 1 to get the degradation multiple for 150pF. The number shown is 0.84. The adjusted propagation delay, to the 10% or 90% point, is therefore 50 x 0.84 or 42nsec. To obtain the rise and fall times check the A.C. specs for the rise and fall times at 4.5V and 125°C to obtain a worst case rise time of 95nsec. Use Figure 2 to find it's degradation multiple to be 0.65. The adjusted rise time is, therefore, 95 x 0.65 or 62nsec. To obtain the standard 50% to 50% propagation delay, add the adjusted propagation delay to half of the adjusted rise time to get a propagation delay of 73nsec. The rise time was used here because it is always the worst case.

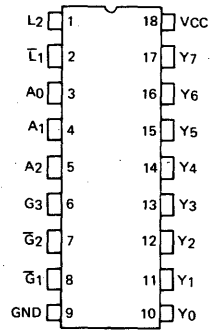
HD-6440
CMOS LATCHED DECODER-DRIVER

Features

- HIGH SPEED DECODING FOR MEMORY ARRAYS
- INCORPORATES 3 ENABLE INPUTS TO SIMPLIFY EXPANSION
- LOW POWER . . . . . TYPICALLY<50 μ W @ 5V STANBDY
- HIGH NOISE IMMUNITY
- AVAILABLE IN BOTH MILITARY AND INDUSTRIAL TEMPERATURE RANGE
- HIGH CAPACITANCE DRIVE 200pF
- HIGH OUTPUT DRIVE . . . . . I_{OH} = -2mA, I_{OL} = 2.4mA
- SINGLE POWER SUPPLY



Description

The HD-6440 is a self aligned silicon gate latched decoder. One of 8 output lines is decoded, and brought to a low state, from the 3 input lines. There are two latch enables ($\overline{L_1}$, L_2), one complemented and one not, to eliminate the need for external gates. The output is enabled by three different output enables ($\overline{G_1}$, $\overline{G_2}$, G_3), two of them complemented and one not. Each output remains in a high state until it is selected, at which time it will go low.

When using high speed CMOS memories, the delay time of the HD-6440 and the enable time of the memory is usually less than the access time of the memory. This assures that memory access time will not be lengthened by the use of the HD-6440 latched decoder driver. The latch is useful for memory mapping or for systems which use a multiplexed bus.

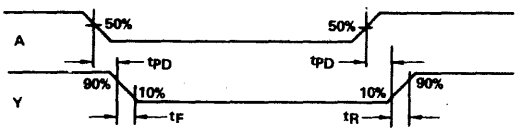
Switching Waveforms

All Inputs have t_R, $t_F \leq 20$ns



OUTPUT TEST CIRCUIT FOR PROPAGATION DELAYS

DECOUPLING CAPACITORS

The Transient current required to charge the load capacitance is given by $I_T = C\frac{dv}{dt}$. Assuming that all outputs may change state at the same time and that $\frac{dv}{dt}$ is constant; $I_T = \left(\Sigma C_L\right)\left(\frac{V_{CC} \times 80\%}{t_R \text{ or } t_F}\right)$ eg. [t_R = 60ns, V_{CC} = 5.0V, each C_L = 200pF, $I_T = (2)\ (200 \times 10^{-12})\ \frac{5.0 \times 0.8}{60 \times 10^{-9}} = 26.7$mA.] This current spike may cause a large negative voltage spike on V_{CC}, which if it becomes a diode drop less than any input, may cause the device to latch up. It is recommended that a 0.1μF ceramic disk decoupling capacitor be placed between V_{CC} and GND at each device to filter out this noise.

PROPAGATION DELAY

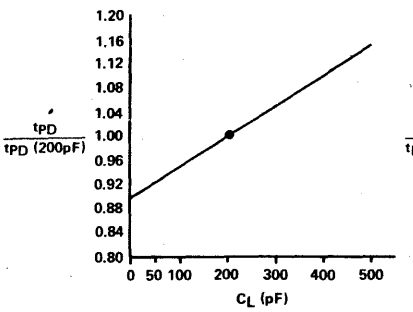


FIGURE 1

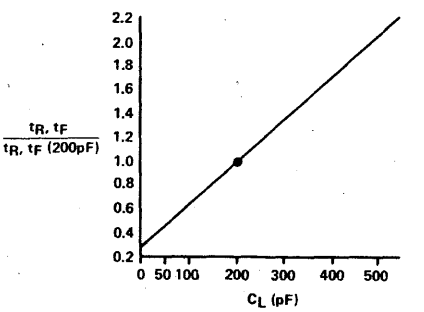

FIGURE 2

The above example will illustrate the calculation of a more useful propagation delay. The system in this example uses a 5 volt supply with a tolerance of ±10%, an ambient temperature of as high as 125°C, and a calculated load capacitance of 150pF. This application requires the HD-6440-2. The table of A.C. specs shows that t_{PD} at 4.5V and 125°C is 100nsec. Use the graph in Figure 1 to get the degradation multiple for 150pF. The number shown is 0.97. The adjusted propagation delay, to the 10% or 90% point, is therefore, 100 x 0.97 or 97nsec. To obtain the rise and fall times check the A.C. specs for the rise and fall times at 4.5V and 125°C to obtain a worst case rise time of 90nsec. Use Figure 2 to find it's degradation multiple to be 0.85. The adjusted rise time is therefore, 90 x 0.85 or 76.5nsec. To obtain the standard 50% to 50% propagation delay, add the adjusted propagation delay to half of the adjusted rise time to get a propagation delay of 135nsec. The rise time was used here because it is always the worst case.

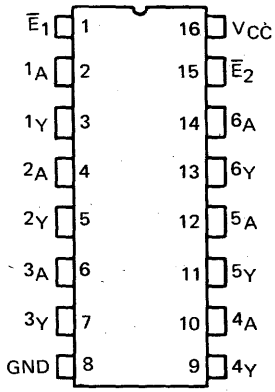
HD-6495

CMOS THREE-STATE BUFFER DRIVER

Features



- SINGLE POWER SUPPLY
- HIGH NOISE IMMUNITY
- INDUSTRIAL AND MILITARY GRADES
- DRIVE CAPACITY 300pF
- SOURCE CURRENT 4mA
- SINK CURRENT 6mA
- PROPAGATION DELAY . . . . . 35nsec @ 5V

Description

The HD-6495 is a self aligned silicon gate CMOS Three-State buffer driver. The circuit consists of 6 non-inverting buffers with separate inputs and outputs which permit this driver to be used for bi-directional or uni-directional busing. A high on either Three-State control line $\overline{E}_1$ or $\overline{E}_2$ will force the drivers to the high impedance mode.

CMOS Manchester Encoder-Decoder

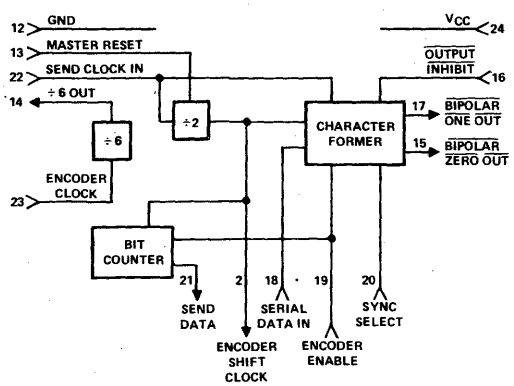
Features

- SUPPORT OF MIL-STD-1553
- 1.25 MEGABIT/SEC DATA RATE
- SYNC IDENTIFICATION AND LOCK-IN
- CLOCK RECOVERY
- MANCHESTER II ENCODE, DECODE
- SEPARATE ENCODE AND DECODE
- LOW OPERATING POWER: 50mW AT 5 VOLTS
- FULL MILITARY TEMPERATURE RANGE

Pinout

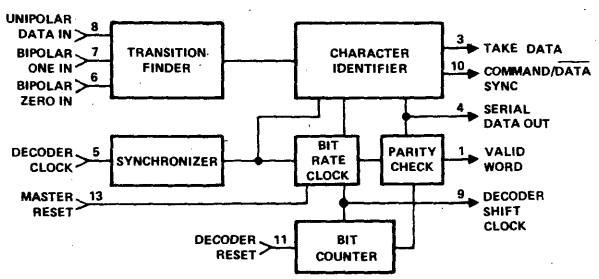
Description

The Harris HD-15530 is a high performance CMOS device intended to service the requirements of MIL-STD-1553 and similar Manchester II encoded, time division multiplexed serial data protocals. This LSI chip is divided into two sections, an Encoder and a Decoder. These sections operate completely independent of each other, except for the Master Reset function.



This circuit provides many of the requirements of MIL-STD-1553. The Encoder produces the sync pulse and the parity bit as well as the encoding of the data bits. The Decoder recognizes the sync pulse and identifies it as well as decoding the data bits and checking parity.

This integrated circuit is fully guaranteed to support the 1MHz data rate of MIL-STD-1553 over both temperature and voltage. It interfaces with CMOS, TTL or N channel support circuitry, and uses a standard 5 volt supply.



The HD-15530 could also be used in many party line digital data communications applications, such as an environmental control system driven from a single twisted pair cable or fiber optic cable throughout the building.

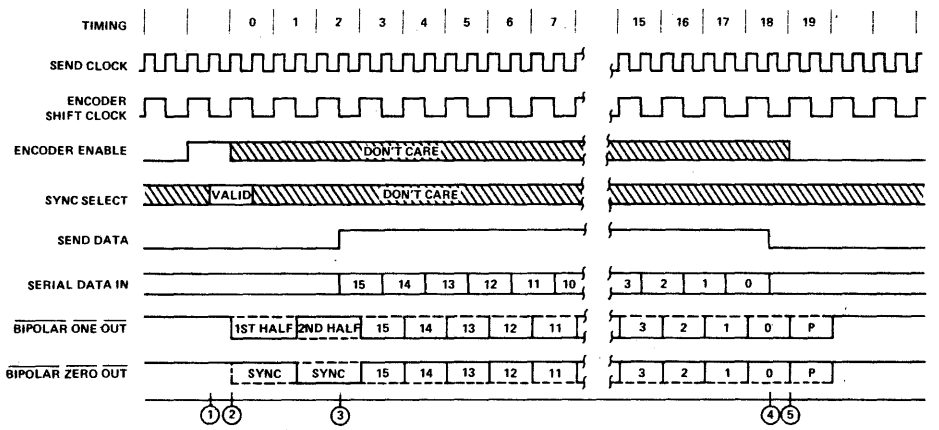
Pin Assignments



PIN	SECTION	NAME	DESCRIPTION
1	Decoder	VALID WORD	Output high indicates receipt of a valid word.
2	Encoder	ENCODER SHIFT CLOCK	Output for shifting data into the Encoder. This clock shifts data on a low-to-high transition.
3	Decoder	TAKE DATA	Output is high during receipt of data after identification fo a sync pulse.
4	Decoder	SERIAL DATA OUT	Delivers received data in correct NRZ format.
5	Decoder	DECODER CLOCK	Input drives the transition finder, and the synchronizer which in turn supplies the clock to the balance of the Decoder.
6	Decoder	BIPOLAR ZERO IN	A high input should be applied when the bus is in its negative state. This pin must be held high when the Unipolar input is used.
7	Decoder	BIPOLAR ONE IN	A high input should be applied when the bus is in its positive state, this pin must be held low when the Unipolar input is used.
8	Decoder	UNIPOLAR DATA IN	With pin 6 high and pin 7 low, this pin enters unipolar data into the transition finder circuit. If not used this input must be held low.
9	Decoder	DECODER SHIFT CLOCK	Output which delivers a frequency (Decoder Clock ÷ 12), synchronized by the recovered serial data stream.
10	Decoder	COMMAND SYNC	Output of a high from this pin occurs during output of decoded data which was preceded by a Command (or Status) synchronizing character. A low output indicates a Data synchronizing character.
11	Decoder	DECODER RESET	A high input to this pin during a rising edge of DECODER SHIFT CLOCK resets the decoder bit counting logic to a condition ready for a new word.
12	Both	GROUND	Ground supply pin.
13	Both	MASTER RESET	A high on this pin clears 2:1 counters in both the Encoder and Decoder.
14	Encoder	÷ 6 OUT	Output from 6:1 divider which is driven by the ENCODER CLOCK.
15	Encoder	$\overline{\text{BIPOLAR ZERO OUT}}$	An active low output designed to drive the zero or negative sense of a bipolar line driver.
16	Encoder	$\overline{\text{OUTPUT INHIBIT}}$	A low on this input forces pin 15 and pin 17 high, the inactive states.
17	Encoder	$\overline{\text{BIPOLAR ONE OUT}}$	An active low output designed to drive the one or positive sense of a bipolar line driver.
18	Encoder	SERIAL DATA IN	Accepts a serial data stream at a data rate equal to ENCODER SHIFT CLOCK.
19	Encoder	ENCODER ENABLE	A high on this input initiates the encode cycle. (Subject to the preceding cycle being complete.)
20	Encoder	SYNC SELECT	Actuates command sync for an input high and data sync for an input low.
21	Encoder	SEND DATA	Is an active high output which enables the external source of serial data.
22	Encoder	SEND CLOCK IN	Clock input at a frequency equal to the data rate X2.
23	Encoder	ENCODER	Input to the 6:1 divider.
24	Both	V_{CC}	Positive supply pin.

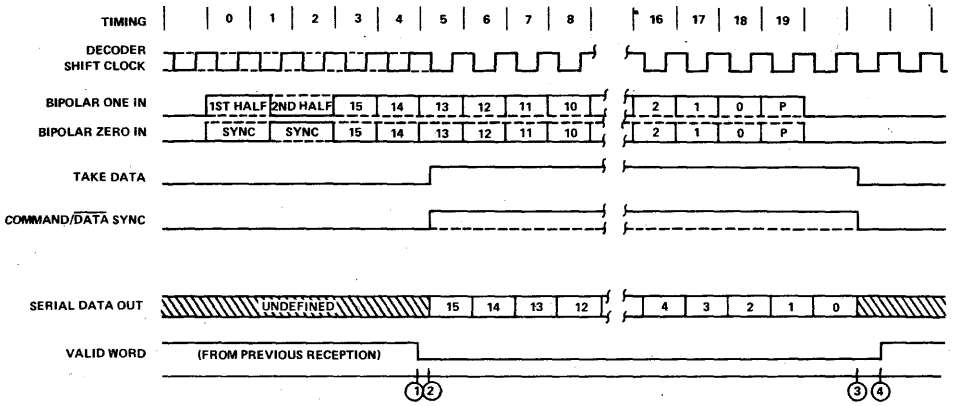
Encoder Operation

The Encoder requires a single clock with a frequency of twice the desired data rate applied at the SEND CLOCK input. An auxillary divide by six counter is provided on chip which can be utilized to produce the SEND CLOCK by dividing the DECODER CLOCK.

The Encoder's cycle begins when ENCODER ENABLE is high during a falling edge of ENCODER SHIFT CLOCK ①. This cycle lasts for one word length or twenty ENCODER SHIFT CLOCK periods. At the next low-to-high transition of the ENCODER SHIFT CLOCK, a high at SYNC SELECT input actuates a command sync or a low will produce a data sync for that word ② . When the Encoder is ready to accept data, the SEND DATA output will go high and remain high for sixteen ENCODER SHIFT CLOCK periods ③ . During these sixteen periods the data should be clocked into the SERIAL DATA input with every low-to-high transition of the ENCODER SHIFT CLOCK ③ – ④ . After the sync and the Manchester II coded data are transmitted through the $\overline{\text{BIPOLAR ONE}}$ and $\overline{\text{BIPOLAR ZERO}}$ outputs, the Encoder adds on an additional bit which is the parity for that word ⑤ . At any time a low on $\overline{\text{OUTPUT INHIBIT}}$ input will force both bipolar outputs to a high state but will not affect the Encoder in any other way.

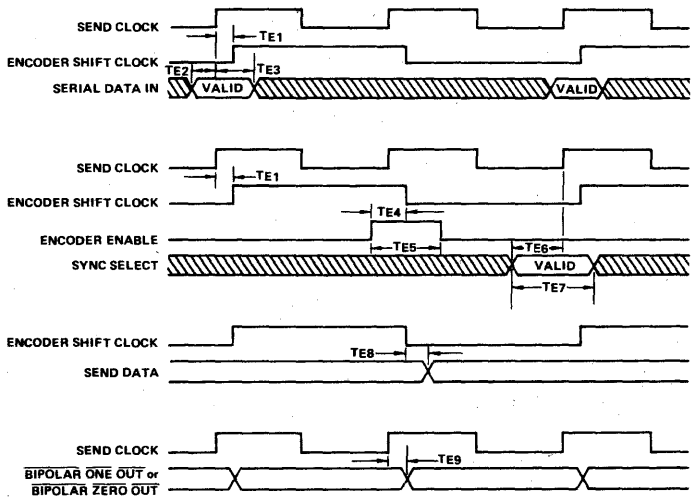
To abort the Encoder transmission a positive pulse must be applied at MASTER RESET. Anytime after or during this pulse, a low to high transition on SEND CLOCK clears the internal counters and initializes the Encoder for a new word.

Decoder Operation



The Decoder requires a single clock with a frequency of 12 times the desired data rate applied at the DECODER CLOCK input. The Manchester II coded data can be presented to the Decoder in one of two ways. The BIPOLAR ONE and BIPOLAR ZERO inputs will accept data from a comparator sensed transformer coupled bus as specified in Military Spec 1553. The UNIPOLAR DATA input can only accept non-inverted Manchester II coded data. (e.g. from $\overline{\text{BIPOLAR ZERO OUT}}$ of an Encoder.)

The Decoder is free running and continuously monitors its data input lines for a valid sync character and two valid Manchester data bits to start an output cycle. When a valid sync is recognized ① , the type of sync is indicated on COMMAND/$\overline{\text{DATA}}$ SYNC output. If the sync character was a command sync, this output will go high ② and remain high for sixteen DECODER SHIFT CLOCK periods ③ , otherwise it will remain low. The TAKE DATA output will go high and remain high ② – ③ while the Decoder is transmitting the decoded data through SERIAL DATA OUT. The decoded data available at SERIAL DATA OUT is in a NRZ format. The DECODER SHIFT CLOCK is provided so that the decoded bits can get shifted into an external register on every low-to-high transition of this clock ② – ③ .



After all sixteen decoded bits have been transmitted ③ the data is checked for odd parity. A high on VALID WORD output ④ indicates a successful reception of a word without any Manchester or parity errors. At this time the Decoder is looking for a new sync character to start another output sequence.

At any time in the above sequence a high input on DECODER RESET during a low-to-high transition of DECODER SHIFT CLOCK will abort transmission and initialize the Decoder to start looking for a new sync character.

The 1553A standard defines a time division multiplexed data bus for application within aircraft. The bus is defined to be bipolar, and encoded in a Manchester II format, so no DC component appears on the bus. This allows transformer coupling and excellent isolation among systems and their environment.

The HD-15531 supports the full bipolar configuration, assuming a bus driver configuration similar to that in Figure 1. Bipolar inputs from the bus, like Figure 2, are also accommodated.

The signaling format in MIL-STD-1553A is specified on the assumption that the network of 32 or fewer terminals are controlled by a central control unit by means of Command Words, and Data. Terminals respond with Status Words, and Data. Each word is preceded by a synchronizing pulse, and followed by parity bit, occupying a total of 20 μ sec. The word formats are shown in Figure 4. The special abbreviations are as follows:

P	Parity, which is defined to be odd, taken across all 17 bits.
R/T	Receive on logical zero, transmit on ONE.
ME	Message Error if logical 1.
TF	Terminal Flag, if set, calls for controller to request self-test data.

The paragraphs above are intended only to suggest the content of MIL-STD-1553A, and do not completely describe its bus requirements, timing or protocols.

HD-15531

CMOS Manchester Encoder-Decoder

Features

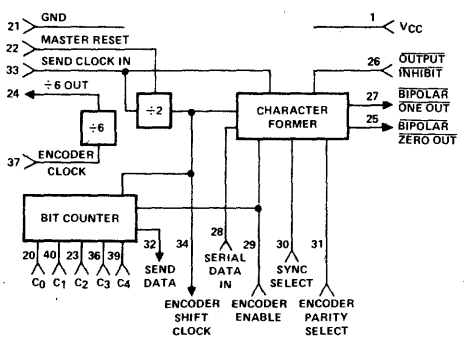
- SUPPORT OF MIL-STD-1553
- 1.25 MEGABIT/SEC DATA RATE
- SYNC IDENTIFICATION AND LOCK-IN
- CLOCK RECOVERY
- VARIABLE FRAME LENGTH TO 32 BITS
- MANCHESTER II ENCODE, DECODE
- SEPARATE ENCODE AND DECODE
- LOW OPERATING POWER: 50mW @ 5 VOLTS
- FULL MILITARY TEMPERATURE RANGE

Pinout

Description

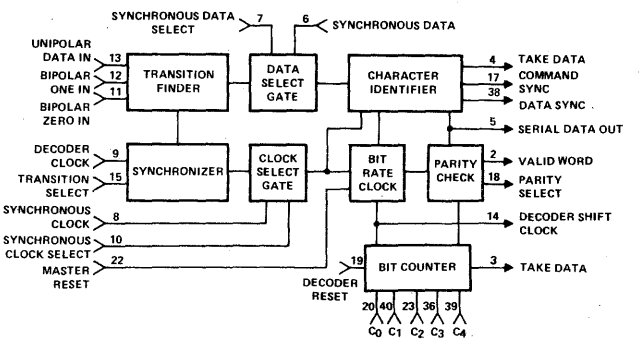
The Harris HD-15531 is a high performance CMOS device intended to service the requirements of MIL-STD-1553 and similar Manchester II encoded, time division multiplexed serial data protocals. This LSI chip is divided into two sections, an Encoder and a Decoder. These sections operate independently of each other, except for the Master Reset and frame length functions.

This circuit provides many of the requirements of MIL-STD-1553. The Encoder produces the sync pulse and the parity bit as well as the encoding of the data bits. The Decoder recognizes the sync pulse and identifies it as well as decoding the data bits and checking parity.



The HD-15531 also surpasses the requirements of MIL-STD-1553 by allowing the frame length to be programmable. The frame length may be programmed from 2 to 28 data bits plus sync and parity. This chip also allows selection of either even or odd parity for the Encoder and Decoder separately.

This integrated circuit is fully guaranteed to support the 1MHz data rate of MIL-STD-1553 over both temperature and voltage. It interfaces with CMOS, TTL or N channel support circuitry, and uses a standard 5 volt supply.



The HD-15531 can also be used in many party line digital data communications applications, such as an environmental control system driven from a single twisted pair or fiber optic cable throughout the building.

Pin Assignments

PIN	SECTION	NAME	DESCRIPTION
1	Both	VCC	Positive supply pin.
2	Decoder	VALID WORD	Output high indicates receipt of a valid word.
3	Decoder	TAKE DATA'	A continuous, free running signal provided for host timing or data handling. When data is present on the bus, this signal will be synchronized to the incoming data and will be identical to take data.
4	Decoder	TAKE DATA	Output is high during receipt of data after identification of a sync pulse
5	Decoder	SERIAL DATA OUT	Delivers received data in correct NRZ format.
6	Decoder	SYNCHRONOUS DATA	Input presents Manchester data directly to character identification logic. SYNCHRONOUS DATA SELECT must be held high to use this input. If not used this pin should be held high.
7	Decoder	SYNCHRONOUS DATA SELECT	In high state allows the synchronous data to enter the character identification logic.
8	Decoder	SYNCHRONOUS CLOCK	Input provides externally synchronized clock to the decoder.
9	Decoder	DECODER CLOCK	Input drives the transition finder, and the synchronizer which in turn supplies the clock to the balance of the decoder.
10	Decoder	SYNCHRONOUS CLOCK SELECT	In high state directs the SYNCHRONOUS CLOCK to control the decoder character identification logic. A low state selects the DECODER CLOCK
11	Decoder	BIPOLAR ZERO IN	A high input should be applied when the bus is in its negative state. This pin must be held high when the unipolar input is used.
12	Decoder	BIPOLAR ONE IN	A high input should be applied when the bus is in its positive state. This pin must be held low when the unipolar input is used.
13	Decoder	UNIPOLAR DATA IN	With pin 11 high and pin 12 low, this pin enters unipolar data into the transition finder circuit. If not used this input must be held low.
14	Decoder	DECODER SHIFT CLOCK	Output which delivers a frequency (DECODER CLOCK ÷ 12), synchronized by the recovered serial data stream.
15	Decoder	TRANSITION SELECT	A high input to this pin causes the transition finder to synchronize on every transition of input data. A low input causes the transition finder to synchronize only on mid-bit transitions.
16	Blank	N.C.	Not connected.
17	Decoder	COMMAND SYNC	Output of a high from this pin occurs during output of decoded data which was preceded by a Command (or Status) synchronizing character
18	Decoder	DECODER PARITY SELECT	An input for parity sense, calling for even parity with input high and odd parity with input low.
19	Decoder	DECODER RESET	A high input to this pin during a rising edge of DECODER SHIFT CLOCK resets the decoder bit counting logic to a condition ready for a new word.
20	Both	COUNT C_0	One of five binary inputs which establish the total bit count to be encoded or decoded.
21	Both	GROUND	Supply pin.
22	Both	MASTER RESET	A high on this pin clears 2:1 counters in both the encoder and decoder.
23	Both	COUNT C_2	See pin 20.
24	Encoder	÷ 6 OUT	Output from 6:1 divider which is driven by the ENCODER CLOCK.
25	Encoder	$\overline{\text{BIPOLAR ZERO OUT}}$	An active low output designed to drive the zero or negative sense of a bipolar line driver.
26	Encoder	$\overline{\text{OUTPUT INHIBIT}}$	A low on this pin forces pin 25 and 27 high, the inactive states.
27	Encoder	$\overline{\text{BIPOLAR ONE OUT}}$	An active low output designed to drive the one or positive sense of a bipolar line driver.
28	Encoder	SERIAL DATA IN	Accepts a serial data stream at a data rate equal to ENCODER SHIFT CLOCK.
29	Encoder	ENCODER ENABLE	A high on this pin initiates the encode cycle. (Subject to the preceeding cycle being complete.)
30	Encoder	SYNC SELECT	Actuates a Command sync for an input high and Data sync for an input low.
31	Encoder	ENCODER PARITY SELECT	Sets transmit parity odd for a high input, even for a low input.
32	Encoder	SEND DATA	Is an active high output which enables the external source of serial data
33	Encoder	SEND CLOCK IN	Clock input at a frequency equal to the data rate X2.
34	Encoder	ENCODER SHIFT CLOCK	Output for shifting data into the Encoder. This shift clock shifts data on a low-to-high transition.
35	Blank	N.C.	Not connected.
36	Both	COUNT C_3	See pin 20.
37	Encoder	ENCODER CLOCK	Input to the 6:1 divider.
38	Decoder	DATA SYNC	Output of a high from this pin occurs during output of decoded data which was preceded by a Data synchronizing character.
39	Both	COUNT C_4	See pin 20.
40	Both	COUNT C_1	See pin 20.

YESTERDAY'S RADIO MASTER IS TODAY'S

ELECTRONIC DISTRIBUTORS MASTER CATALOG

First published to serve you in 1935, The Radio Electronic Master has continuously changed over the years to better meet your needs. Today The Radio Master has become The Electronic Distributors MASTER CATALOG.

The 1979 edition of The Electronic Distributors MASTER CATALOG includes components, systems and subsystems sold through distributors.

It encompasses the following product areas: electronic and electromechanical components, audio and communications equipment, sub-assembly and panel components, hardware, production equipment and tools, test instrumentation, power sources, wire and cable, and chemicals.

The MASTER CATALOG is divided into four basic sections:

The **GENERAL INDEX** lists manufacturers and products alphabetically, including product cross references. Page numbers are displayed for both manufacturers and products. Manufacturers names are **bold-faced.**

The **MANUFACTURERS' CATALOG SECTION** is a collection of their respective product pages, alphabetically by manufacturer, again including addresses and phone numbers.

The **MANUFACTURERS DIRECTORY** is an alphabetical listing of all manufacturers whose products information is shown. Page numbers are referenced. Sales offices, representatives and distributors are included for many manufacturers.

The **DEALER/DISTRIBUTOR DIRECTORY** geographically lists distribution outlets by state and city. The listings were supplied by manufacturers cataloging in this edition.

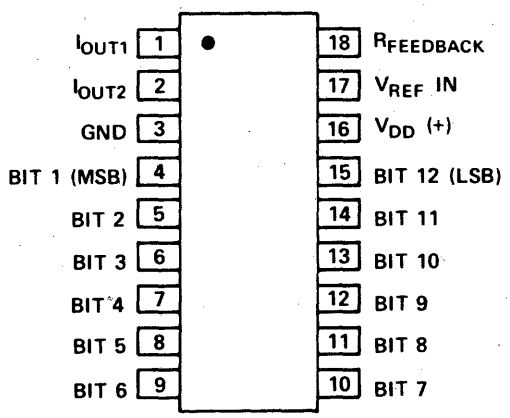
MICRO POWER SYSTEMS

CMOS 12-Bit Monolithic Multiplying DAC

MP7621/7541



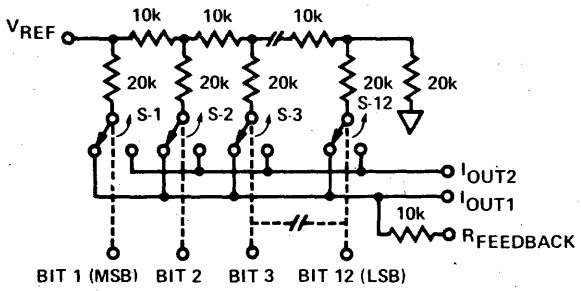
FEATURES

- 12-Bit Linearity (0.01%), achieved *without trimming* of ladder Rs
- Full Four-Quadrant Multiplication
- 2 ppm/°C Gain Error Tempco
- Plug-In Replacement For AD7541
- TTL/CMOS Compatible
- Low Power Consumption
- Low Feedthrough Error
- Low Cost

APPLICATIONS

Digital/Synchro Conversion
Programmable Amplifiers
Ratiometric A/D Conversion
Function Generation

PIN CONFIGURATION



TOP VIEW

GENERAL DESCRIPTION

The MP7621 is a 12-bit monolithic digital-to-analog converter, featuring high-density CMOS. Precision thin-film deposition allows 12-bit linearity without laser trimming, thus eliminating any long-term instabilities the laser might introduce. Thermal compensation reduces Gain Error Tempco to 2 ppm/°C maximum.

Also, the MP7621 is a pin-compatible replacement for Analog Devices' AD7541. It meets or exceeds the performance of that device.

CIRCUIT DESCRIPTION

GENERAL CIRCUIT INFORMATION

The MP7621, a 12-bit multiplying D/A converter, consists of a highly stable thin film R-2R ladder and twelve CMOS current switches on a monolithic chip. Most applications require the addition of only an output operational amplifier and a voltage or current reference.

The simplified D/A circuit is shown above. An inverted R-2R ladder structure is used– that is, the binarily weighted currents are switched between the I_{OUT1} and I_{OUT2} bus lines thus maintaining a constant current in each ladder leg independent of the switch state.

CAUTION

1. Do not apply voltages higher than V_{DD} or less than GND potential on any terminal except V_{REF}.
2. The digital control inputs are zener protected; however permanent damage may occur on unconnected units under high energy electrostatic fields. Keep unused inputs in conductive foam at all times.

SPECIFICATION DEFINITIONS

NONLINEARITY: Error contributed by deviation of the DAC transfer function from a best straight line function. Normally expressed as a percentage of full scale range. For a multiplying DAC, this should hold true over the entire V_{REF} range.

RESOLUTION: Value of the LSB. For example, a unipolar converter with n bits has a resolution of (2^{-n}) (V_{REF}). A bipolar converter of n bits has a resolution of $[2^{-(n-1)}]$ $[V_{REF}]$. Resolution in no way implies linearity.

SETTLING TIME: Time required for the output function of the DAC to settle to within 1/2 LSB for a given digital input stimulus, i.e., 0 to Full Scale.

GAIN: Ratio of the DAC's operational amplifier output voltage to the input voltage.

FEEDTHROUGH ERROR: Error caused by capacitive coupling from V_{REF} to output with all switches OFF.

OUTPUT CAPACITANCE: Capacity from I_{OUT1} and I_{OUT2} terminals to ground.

OUTPUT LEAKAGE CURRENT: Current which appears on I_{OUT1} terminal with all digital inputs LOW or on I_{OUT2} terminal when all inputs are HIGH.

©IC MASTER 1979

TYPICAL PERFORMANCE CHARACTERISTICS

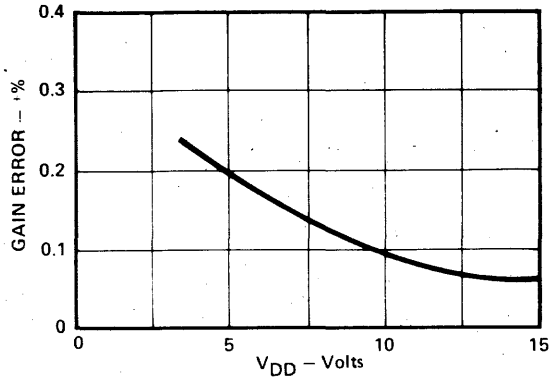

Figure 1. Gain Error vs. Supply Voltage

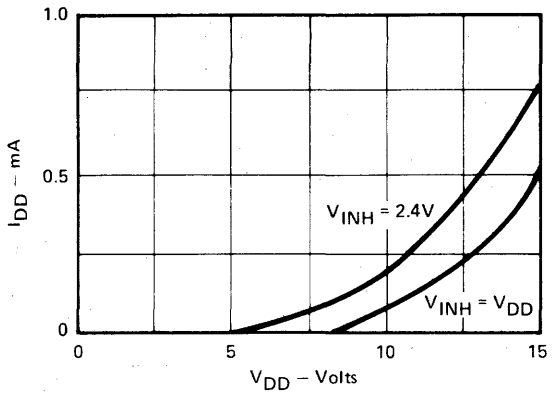

Figure 2. Supply Current vs. Supply Voltage

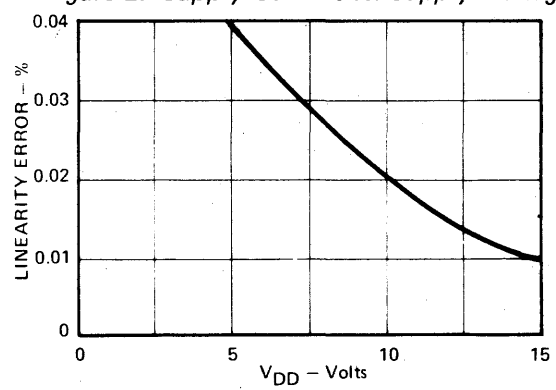

Figure 3. Linearity Error vs. Supply Voltage

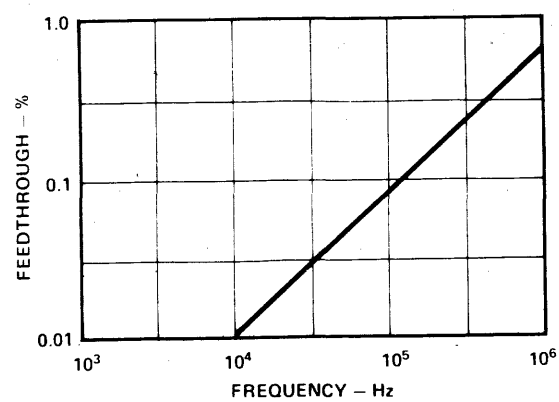

Figure 4. Feedthrough Error vs. Frequency

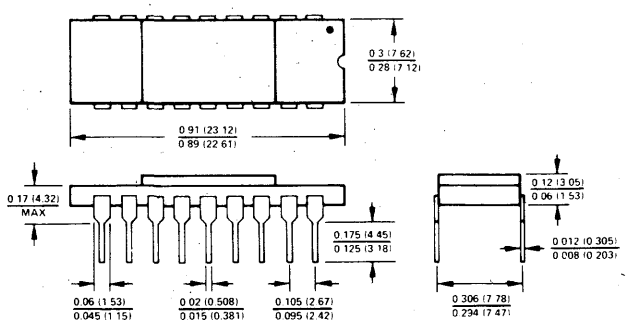
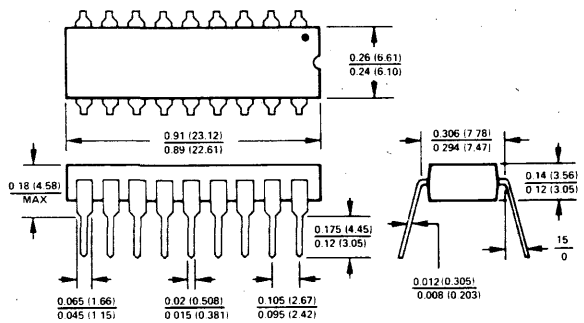
APPLICATION HINTS

Linearity depends upon the potential of I_{OUT1} and I_{OUT2} (pin 1 and pin 2) being exactly equal to GND (pin 3) and the output amplifier's non-inverting (+) input. Careful PC board layout and adjustment and selection of the amplifier's offset voltage and bias current are necessary.



The input structures of some high speed operational amplifiers can attempt to draw substantial current during switch-on. Schottky diodes should be used in these circumstances to prevent the absolute maximum rating for V_{OUT1} and V_{OUT2} being exceeded.

The power supply should be carefully checked for noise, which would affect performance, and overshoot which could damage the device.



Unused digital inputs must always be grounded or taken to V_{DD} to ensure correct operation. Particular care should be taken when digital inputs are routed to another PC card. It is recommended that inputs open-circuited when PC cards are disconnected be taken to V_{DD} or GND via high value (1MΩ) resistors to prevent the accumulation of static charges.

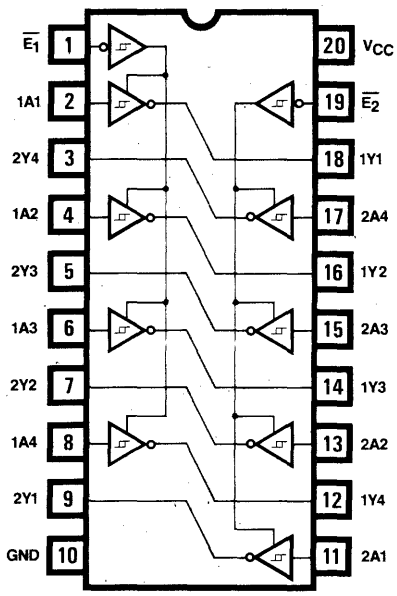
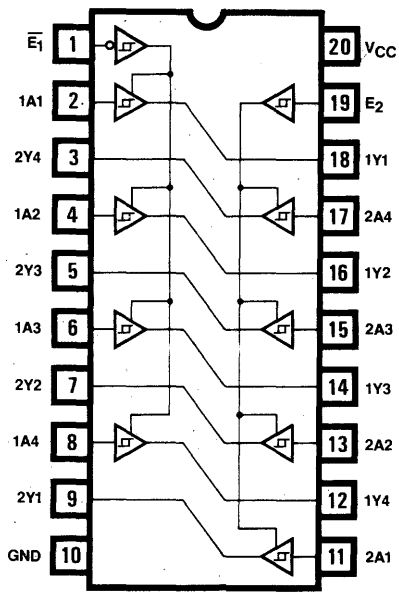
Description

The Octal Buffers provide high speed and high current interface capability for bus organized Digital Systems. The three-state drivers will source a termination to ground (up to 133Ω) or sink a pull-up to V_{CC} as in the popular 220Ω/330Ω computer peripheral termination. The PNP inputs provide improved fan-in with 0.2 mA I_{IL} on the Low Power Schottky buffers and 0.4 mA I_{OC} on the Schottky buffers.



The 240 and 244 provide inverting and non-inverting outputs with active low enables. The 241 and 306 provide inverting and non-inverting outputs with both active low and active high enables allowing transceiver operation.

In addition to the standard Schottky and Low Power Schottky Octal Buffers, Monolithic Memories provides a full hysteresis with "a true" Schmitt trigger circuit. The improved performance characteristics are designed to be consistent with the SN54/74LS14 Hex Schmitt trigger and guarantee a full 400 mV noise immunity.



The Schmitt Trigger operation makes the LS buffers ideal for bus receivers in a noisy environment. The Schmitt Trigger operation on the S buffers acts as a safeguard against feedback oscillation and prevents slow transitions through the threshold region, insuring fast transitions and reducing I_{CC} spikes.

Octal Transceiver

SN74LS245, SN54LS245
67LS305, 67LS310, 57LS305, 57LS310

Features/Benefits

- **3-state outputs drive bus lines**
- **Schmitt trigger guarantees high noise margin**
- **Low current PNP inputs reduce loading**
- **20 pin Skinny DIP™ saves space**
- **8 bits matches byte boundaries**
- **Ideal for microprocessor interface**

Description

These Octal Bus transceivers are designed for asynchronous two-way communication between data buses. The control function implementation minimizes external timing requirements.

The device allows data transmission from the A bus to the B bus or from the B bus to the A bus depending upon the logic level at the direction control (DIR) input. The enable input ($\overline{E}$) can be used to disable the device so that the buses are effectively isolated.

In addition to the standard Octal transceivers, Monolithic Memories provides a full hysteresis with "a true" Schmitt Trigger circuit. The improved performance characteristics are designed to be consistent with the SN54/74LS14 Hex Schmitt Trigger and guarantee a full 400 mV noise immunity.

The Schmitt Trigger operation makes these LS transceivers ideal for noisy bus environments.

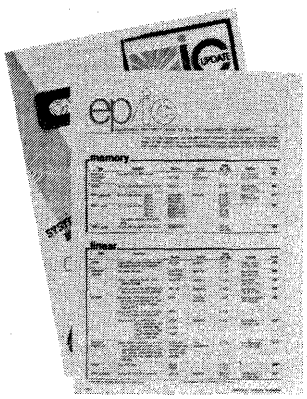
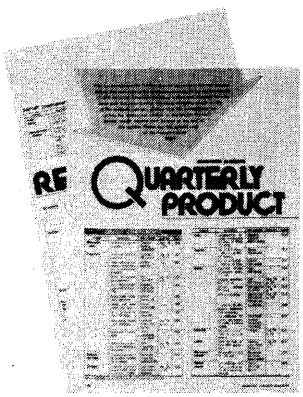
SUBSCRIBE TO ELECTRONIC PRODUCTS MAGAZINE. IT'S YOUR *COMPLETE* GUIDE TO EVERYTHING THAT'S NEW IN THE FAST-CHANGING WORLD OF ELECTRONIC PRODUCTS AND SYSTEMS.



FEATURE STORIES every month on electronic products, applications and availability.

FORUMS—Reports on meetings of manufacturers, users and distributors. Get the very latest news on a wide variety of products.

NEW PRODUCT NEWS—Hundreds of new products are introduced each month. You'll get the facts on not only what the new product is, but also where to get it, basic prices and current delivery.



EP/IC UPDATE—Exclusive in ELECTRONIC PRODUCTS. A monthly report on *everything* that's new in the fast-moving world of integrated circuits.

QUARTERLY PRODUCT REVIEW—Another exclusive in ELECTRONIC PRODUCTS. A complete report of *every* new electronic product introduced in the previous quarter. This feature is in the January, April, July and October issues.

QUARTERLY PRODUCT PLANNING DIRECTORY—A compilation of the latest catalogs of a wide variety of electronic products and systems.

OUTLOOK—Important industry news affecting electronic products and systems.

COMPONENT CAPERS—A humorous look at the strange and wonderful world of electronics.

MINI-GLOSSARIES, Quizzes and more—Each and every month for over twenty years the readers of ELECTRONIC PRODUCTS learn something new about the products they work with and specify.

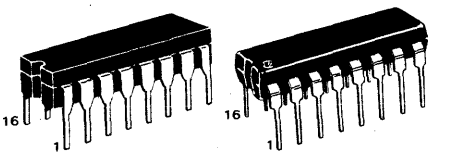
McMOS MSI

(LOW-POWER COMPLEMENTARY MOS)



HIGH SPEED PROGRAMMABLE DIVIDE-BY-N DUAL 4-BIT BCD/BINARY COUNTER

HIGH SPEED PROGRAMMABLE DIVIDE-BY-N DUAL 4-BIT BCD/BINARY COUNTER

The MC14569B is a high speed programmable divide-by-N dual 4-bit BCD or binary down counter constructed with MOS P-channel and N-channel enhancement mode devices (complementary MOS) in a single monolithic structure.

It has been designed for use with the MC14568B phase comparator/counter in frequency synthesizers, phase-locked loops, and other frequency division applications requiring low power dissipation and/or high noise immunity.

- 9.5 MHz Typical Counting Rate at 10 V for Any Division Ratio Greater Than 1
- Speed-up Circuitry for Zero Detection and Preset Enable
- Each 4-Bit Counter Can Divide Independently in BCD or Binary Mode
- Quiescent Current = 5 nA typ/pkg @ 5 Vdc
- Can be Cascaded With MC14568B, MC14522B and MC14526B for Frequency Synthesizer Applications

		10	(1.20 μA/kHz) f + I_{DD}							
		15	(1.95 μA/kHz) f + I_{DD}							

*T_{low} = -55°C for AL Device, -40°C for CL/CP Device.
T_{high} = +125°C for AL Device, +85°C for CL/CP Device.
#Noise immunity specified for worst-case input combination.
Noise Margin for both "1" and "0" level = 1.0 Vdc min @ V_{DD} = 5.0 Vdc
2.0 Vdc min @ V_{DD} = 10 Vdc
2.5 Vdc min @ V_{DD} = 15 Vdc
†To calculate total supply current at loads other than 50 pF:
$I_T(C_L) = I_T(50\ pF) + 1 \times 10^{-3} (C_L - 50) V_{DD} f$
where: I_T is in μA (per package), C_L in pF, V_{DD} in Vdc, and f in kHz is input frequency.
**The formulas given are for the typical characteristics only at 25°C.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit. For proper operation it is recommended that V_{in} and V_{out} be constrained to the range $V_{SS} \leq (V_{in}$ or $V_{out}) \leq V_{DD}$.
Unused inputs must always be tied to an appropriate logic voltage level (e.g., either V_{SS} or V_{DD}).

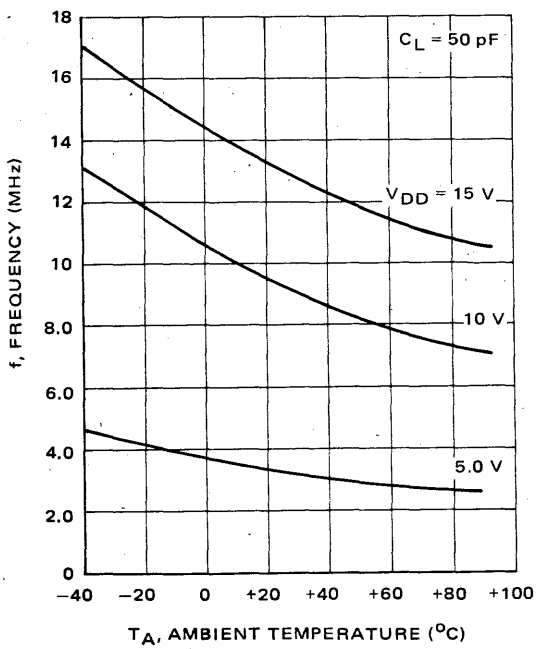
OPERATING CHARACTERISTICS

The MC14569B includes a high speed Johnson counter followed by a BCD/binary 4-bit synchronous counter (see block diagram). The use of an encoder allows the Johnson counter to be programmed (i.e. preset) in BCD or binary code through inputs D_{PA1}, D_{PA2}, D_{PA3}, and D_{PA4}.



The BCD/binary counter can be programmed through inputs D_{PB1}, D_{PB2}, D_{PB3}, and D_{PB4}. For each counter a divide ratio of 10 (BCD count) or 16 (binary count) can be chosen independently by inputs CTL_A and CTL_B respectively. When one of those inputs is set high, the divide ratio of the corresponding counter is 10 (BCD); when it is set low, the division ratio is 16 (binary).

A Cascade Feedback input (pin 7), a Q output (pin 15) and a Preset Enable output (pin 1) made it possible to cascade the MC14568B, MC14522B and MC14526B with this device. CF, Q and PE_{out} of MC14569B must be respectively connected to "0", C and PE of the following counter.

When MC14569B is used alone, CF must be connected to V_{DD}. One pulse will appear on output PE_{out} every N clock periods (N being the value programmed on the D_P inputs). Both counters included in MC14569B, and eventually all the counters which are cascaded, should normally be preset at the programmed values during the clock period where they all reach the count zero. For best speed performance, preset is started as soon as count 1 is detected. As a consequence, it is not possible to program a frequency division ratio of one. However, it is possible to program a division ratio of 11 (i.e. $D_{PA1}, \ldots D_{PA4}$ = 1,0,0,0 and $D_{PB1}, \ldots D_{PB4}$ = 1,0,0,0), or a division ratio of 101 if another counter is cascaded with the MC14569B.

This high speed configuration makes it possible to guarantee a maximum clock pulse frequency of 5.7 MHz for a 10 V V_{DD} supply for any division ratio greater than one. Due to the presence of the early zero detection, the circuit must be used in the two least significant digit positions.

Because all the circuitry is static, there is no minimum frequency specification for the Clock input, C (pin 9).

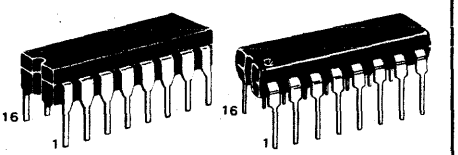
Advance Information

CMOS MSI

(LOW-POWER COMPLEMENTARY MOS)



MICROPROCESSOR BASED
ANALOG TO DIGITAL CONVERTER

ANALOG TO DIGITAL CONVERTER LINEAR SUBSYSTEM

The MC14443 and the MC14447 devices are 6 channel, single slope, 8–10 bit analog to digital converter linear subsystems for microprocessor based data and control, systems. Contained in both devices are a one of 8 decoder, an 8 channel analog multiplexer, a buffer amplifier, a precision voltage to current converter, a ramp start circuit, and a comparator. The output driver of the MC14443 comparator is an open-drain N-channel capable of sinking up to 5 mA of current. The output of the MC14447 comparator has a standard B-Series P-channel, N-channel pair.

A processor system (such as the MC6800, MC141000 or MC3870) provides the addressing, timing, counting, and arithmetic operations required for implementing a full analog to digital converter system. A system made up of a processor and the linear subsystem has features such as automatic zeroing and variable scaling (weighting) of six separate analog channels.

- Quiescent Current 0.8 mA Typical at V_{DD} = 5 V
- Single Supply Operation +4.5 to +18 Volts
- MPU Compatible
- Typical Resolution — 10 Bits
- Typical Conversion Cycle as Fast as 300 μs
- Ratio Metric Conversion Minimizes Error

DEVICE OPERATION

ADDRESS INPUTS SELECT (A0, A1, A2, Pins 1, 2, 16) The input voltage source to be presented to the measurement system according to the Truth Table shown in Figure 3.

RAMP START (Ramp Start, Pin 3) When the Ramp Start is low, the ramp capacitor is charged to a voltage associated with the selected input channel. When the Ramp Start is brought high,the connection to the input channel is broken and the capacitor begins to ramp toward V_{SS}.

RAMP CAPACITOR (Ramp Cap, Pin 4) The ramp capacitor is used to generate a time period when discharged from a selected voltage via a precise reference current.

NEGATIVE POWER SUPPLY (V_{SS}, Pin 5) This pin is system ground.

REFERENCE CURRENT (Ref Current, Pin 6) To discharge the ramp capacitor, the reference current is fixed via a resistor (R_{Ref}) to a positive supply from pin 6. Typical current is equal to $(V_{DD} - V_{Ref})/R_{Ref}$.

COMPARATOR OUTPUT (Comp Out, Pin 7) This output is low when the capacitor has reached the discharged voltage and is high otherwise.

REFERENCE VOLTAGE (Ref Voltage, Pin 8) This voltage can be set to a voltage between V_{SS} + 2 V and V_{DD} – 2 V. This is the known voltage to which the unknown is compared.

INPUT CHANNELS (Pins 9, 10, 11, 12, 13, 15) Input channels 1 through 6 are used to monitor up to six separate unknown voltages. Selection is via the address inputs.

POSITIVE POWER SUPPLY (V_{DD}, Pin 14) This pin is the package positive power supply pin.

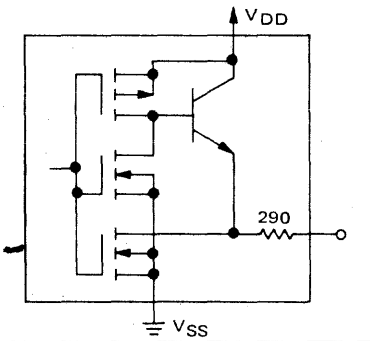
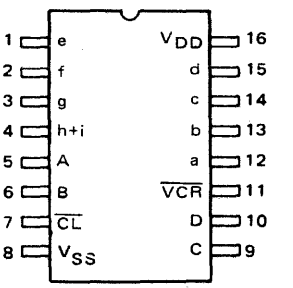
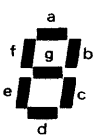
BCD-TO-SEVEN SEGMENT HEXADECIMAL LATCH/DECODER/DRIVER



BCD-TO-SEVEN SEGMENT HEXADECIMAL LATCH/ DECODER/DRIVER

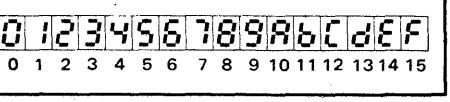


The MC14495 BCD-to-seven segment hexidecimal latch/decoder/ driver is constructed with complementary MOS (CMOS) enhancement mode devices and NPN bipolar output drivers in a single monolithic structure. The circuit provides the functions of a 4-bit storage latch. It can be used with LED seven segment displays without resistor interface at 5 volt supply. The resistors of typically 290 ohms are internal to the part.



Applications include MPU systems display driver, instrument display driver, computer/calculator display driver, cockpit display driver, and various clock, watch, and timer uses.

- Low Logic Circuit Power Dissipation
- High-Current Sourcing Outputs With Internal Limiting Resistance
- Latch Storage of Code
- Supply Voltage Range = 4.5 Vdc to 16 Vdc
- Internal Input Level Shift:
  Input +5 CMOS to V_{DD} of +5 to +16 Vdc
  Input +5 V TTL with Pull-up, to V_{DD} of +5 to +16 Vdc



OUTPUT CIRCUIT
(Except Pin 11)

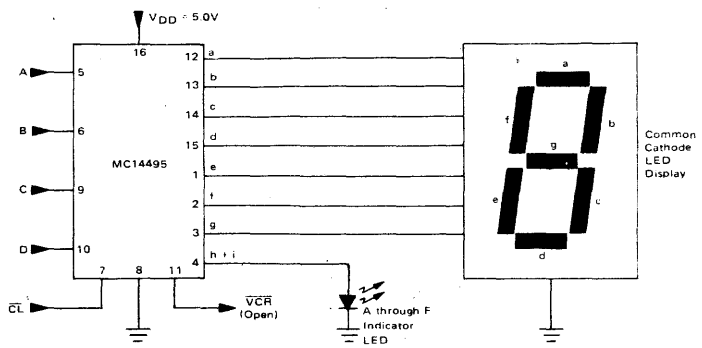
INPUT/OUTPUT FUNCTIONS

Segment Driver (a, b, c, d, e, f, g, h, i; Pins 1, 2, 3, 4, 12, 13, 14, 15)

The segment drivers are emitter-follower NPN-transistors. To limit the output current, a resistor typically 290 ohms is integrated internally at each output. Therefore, external resistors are not necessary when driving an LED at the supply voltage of V_{DD} = 5.0 volts.

OUTPUT ($\overline{VCR}$; Pin 11)

This output is activated (goes to low) whenever the address corresponding to program 16 is selected. Otherwise the output is open. See the truth table.



INPUT LATCH (A,B, C, D; Pins 5, 6, 8, 10)

The block diagram is shown on page 1. The inputs A, B, C, and D are fed to a 4-bit latch which is controlled by clock ($\overline{CL}$). Two modes of operation are available.

CLOCK ($\overline{CL}$; Pin 7)

The data on the inputs A, B, C and D will pass through the latch and will be displayed immediately when the clock is low. In this mode of operation the circuit is performing the function of a conventional decoder/driver. The data may be loaded into the latch when $\overline{CL}$ = low and will be latched with the rising edge of $\overline{CL}$. The data will remain stored as long as $\overline{CL}$ is high.

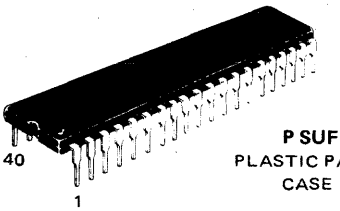
MC14469

ADDRESSABLE ASYNCHRONOUS RECEIVER/TRANSMITTER

The MC14469 Addressable Asynchronous Receiver Transmitter is constructed with MOS P-channel and N-channel enhancement devices in a single monolithic structure (CMOS). The MC14469 receives one or two eleven-bit words in a serial data stream. One of the incoming words contains the address and when the address matches, the MC14469 will then transmit its information in two eleven-bit-word data streams. Each of the transmitted words contains eight data bits, even parity bit, start and stop bit.

The received word contains seven address bits and the address of the MC14469 is set on seven pins. Thus 2^7 or 128 units can be interconnected in simplex or full duplex data transmission. In addition to the address received, seven command bits may be received for data or control use.



The MC14469 finds application in transmitting data from remote A-to-D converters, remote MPUs or remote digital transducers to the master computer or MPU.

- Supply Voltage Range – 4.5 Vdc to 18 Vdc
- Low Quiescent Current – 75 μAdc maximum @ 5 Vdc
- Data Rates to 4800 Baud
- Receive – Serial to Parallel
  Transmit – Parallel to Serial
- Transmit and Receive Simultaneously in Full Duplex
- Crystal or Resonator Operation for On-Chip Oscillator

TYPICAL RECEIVE/SEND CYCLE

©IC MASTER 1979

DEVICE OPERATION

OSCILLATOR (Osc1, Osc2; Pins 1, 2) — These pins are the oscillator input and output. (See Figure 1.)

RESET ($\overline{\text{Reset}}$; Pin 3) — When this pin is pulled low, the circuit is reset and ready for operation.

ADDRESS (A0-A6; Pin 4, 5, 6, 7, 8, 9, 10) — These are the address setting pins which contain the address match for the received signal.

INPUT DATA (ID0-ID7; Pins 11, 12, 13, 14, 15, 16, 17, 18) — These pins contain the input data for the first eight bits of data to be transmitted.

RECEIVE INPUT (RI; Pin 19) — This is the receive input pin.

NEGATIVE POWER SUPPLY (V_{SS}; Pin 20) — This pin is the negative power supply connection. Normally this pin is system ground.

TRANSMIT REGISTER OUTPUT SIGNAL ($\overline{\text{TRO}}$; Pin 21) — This pin transmits the outgoing signal. Note that it is inverted from the incoming signal. It must go through one stage of inversion if it is to drive another MC14469.

SECOND or STATUS INPUT DATA (S0-S7; Pins 22, 23, 24, 25, 26, 27, 28, 29) — These pins contain the input data for the second eight bits of data to be transmitted.

SEND (Send; Pin 30) — This pin accepts the send command after receipt of an address.

VALID ADDRESS PULSE (VAP; Pin 31) — This is the output for the valid address pulse upon receipt of a matched incoming address.

COMMAND STROBE (CS; Pin 32) — This is the output for the command strobe signifying a valid set of command data on pins 33-39.

COMMAND WORD (C0-C6; Pins 33, 34, 35, 36, 37, 38, 39) — These pins are the readout of the command word which is the second word of the received signal.

POSITIVE POWER SUPPLY (V_{DD}; Pin 40) — This pin is the package positive power supply pin.

OPERATING CHARACTERISTICS

The receipt of a start bit on the Receive Input (RI) line causes the receive clock to start at a frequency equal to that of the oscillator divided by 64. All received data is strobed in at the center of a receive clock period. The start bit is followed by eight data bits. Seven of the bits are compared against states of the address of the particular circuit (A0-A6), while the eighth bit signifies an address word "1", or a command word "0". Next, a parity bit is received and checked by the internal logic for even parity. Finally a stop bit is received. At the completion of the cycle if the address compared, a Valid Address Pulse (VAP) occurs. Immediately following the address word, a command word is received. It also contains a start bit, eight data bits, even parity bit, and a stop bit. The eight data bits are composed of a seven-bit command, and a "0" which indicates a command word. At the end of the command word a Command Strobe Pulse (CS) occurs.

A positive transition on the Send input initiates the transmit sequence. Again the transmitted data is made up of two eleven-bit words, i.e., address and command words. The data portion of the first word is made up from Input Data inputs (ID0-ID7), and the data for the second word from Second Input Data (S0-S7) inputs. The data on inputs S0-S7 is latched before the start of transmit of the first of the second two words. The transmitted signal is the inversion of the received signal, which allows the use of an inverting amplifier to drive the lines.

The oscillator can be crystal controlled or ceramic resonator controlled for required accuracy. Pin 1 may be driven from an external oscillator. See Figure 1.

DP8350 Series Programmable CRT Controllers

General Description

The DP8350 Series of CRT Controllers are single-chip bipolar (I^2L technology) circuits in a 40-pin package. They are designed to be dedicated CRT display refresh circuits.

The CRT Controller (CRTC) provides an internal dot rate crystal controlled oscillator for ease of system design. For systems where a dot rate clock is already provided, an external clock input may be used by the CRTC. In either case system synchronization is made possible with the use of the buffered Dot Rate Clock Output.

The DP8350 Series has 11 character generation related timing outputs. These outputs are compatible for systems with or without line buffers, using character ROMS, or DM8678-type latch/ROM/shift register circuits.

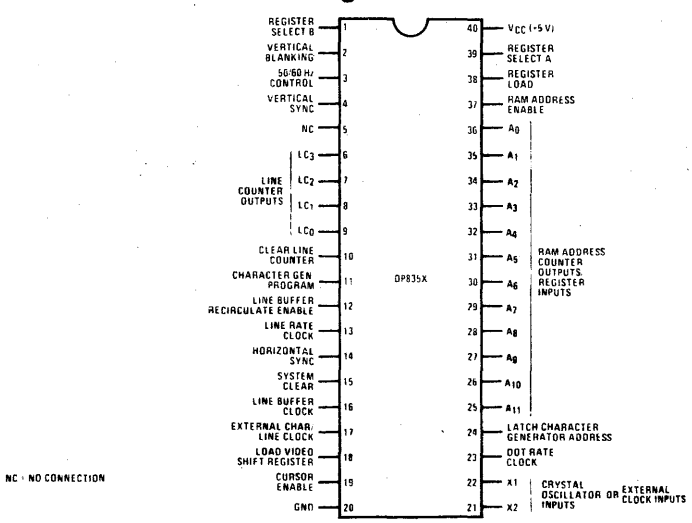
12 bits (4k) of bidirectional TRI-STATE® character memory addresses are provided by the CRTC for direct interface to character memory.

Three on-chip registers provide for external loading of the row starting address, cursor address, and top-of-page address.

A complete set of video outputs is available including cursor enable, programmable vertical blanking, programmable horizontal sync, and programmable vertical sync.

The DP8350 Series CRTC provides for a wide range of programmability using internal mask programmable ROMs:

- Character Field (both number of dots/character and number of scan lines/character)
- Characters per Row
- Character Rows per Video Frame



The CRTC also provides system sync and program inputs including 50/60 Hz control, system clear, external character/line rate clock, and character generator program.

The DP8350 Series operates on a single +5 V power supply. Outputs and inputs are TTL compatible.

Features

- Internal crystal controlled dot rate oscillator
- External dot rate clock input
- Buffered dot rate clock output
- Timing pulses for character generation
- Character memory address outputs (12 bits)
- Internal cursor address register
- Internal row starting address register
- Top-of-page address register (for scrolling)
- Programmable horizontal and vertical sync outputs
- Programmable cursor enable output
- Programmable vertical blanking output
- 50/60 Hz refresh rate
- Programmable characters/row (5 to 110)
- Programmable character field size (up to 16 dots x 16 scan line field size)
- Programmable character rows/frame (1 to 64)
- Single +5 V power supply
- Inputs and outputs TTL compatible
- Ease of system design/application

DP8350 Functional Pin Description

CHARACTER GENERATION/TIMING OUTPUTS

The CRTC provides 11 interface timing outputs for line buffers, character generator ROM, DM8678-type latch/ROM/shift register combination character generators, and system status timing. All outputs are TTL compatible and directly interface to popular system circuits, including:

- DM8678 Series Character Generators
- MM52157, MM52179 Character ROMs
- DM74166 Dot Shift Register
- MK1007P, 33571/2, 2532 80-Bit Shift Registers (Line Buffers)

Dot Rate Clock: This output is buffered for use in system synchronization and interface to dot shift register. Positive edge clock at crystal oscillator frequency.

Load Video Shift Register: Buffered output at character rate frequency. Used for direct interface to dot shift register. This output is active only during video time and therefore performs both the horizontal and vertical blanking functions. Low level active.

Latch Character Generator Address: Buffered output at character rate frequency. Active at all times. Positive edge clock.

Line Buffer Clock: This output directly interfaces to line buffers. Output operates at character rate. Negative edge clock. Not active during horizontal blanking. The number of clocks per scan line is equivalent to the number of video characters per row.

Line Rate Clock: Line rate frequency output for use with DM8678-type character generator.

Line Counter Outputs (LC_0 to LC_3): Buffered outputs at line rate frequency for use with character ROMs without internal line counter. These outputs are also useful for system decode of present line position in character row. Outputs clock in sync with Line Rate Clock at start of horizontal blanking. Outputs are always active.

Clear Line Counter: Row rate clock – occurs in sync with Line Rate Clock during horizontal blanking between last line of any row and first line of a new row. This output is always active and is a negative edge clock – direct interface to the DM8678.

Line Buffer Recirculate Enable: This output interfaces to a line buffer and becomes inactive (logic "0" state) during the last line or the first line of a character row, depending on the state of the character generator program input. A low level on this output indicates (in line buffer applications) the time during which the line buffer is loaded with the next row of character codes.

Table 1. Character Generator Program Truth Table

Character Generator Program Input	Recirculate Enable Output Low Level and New Row Address at Address Outputs
"0"	Last line of character row
"1"	First line of character row

The pulse appears at the start of horizontal blanking prior to when the memory address bus must be transferred to the CRTC, then returns to the high state at the next horizontal blanking interval.

MEMORY ADDRESS OUTPUTS/INPUTS AND REGISTERS

CRT Character Address Outputs (TRI-STATE) – A_0 to A_{11}: 12 bits of bidirectional CRT character address counter outputs are provided by the CRTC. These outputs directly interface to the system RAM memory address bus.

Within a scan line the counter is pre-set to the address contained within the Row Start Register (RSR) three character times before the start of video time. The counter is then advanced sequentially at character rate to the max video character address plus 1 for the present scan line. This address is then held during the horizontal blanking interval up to three character times before video start for the next scan line. At this point the counter is again pre-set to the contents of the RSR and the above sequence is repeated. This sequence provides scan line address repetition for every scan line of a character location within a row. Row-to-row start address modifications are accomplished by updating the contents of the RSR.

During vertical blanking the address counter operation is modified by stopping the pre-set load of the contents of the RSR into the address counter, thereby allowing the address outputs to free run during vertical blanking. This allows minimum access time to the CRTC when the CRTC address counter outputs are being used for dynamic RAM refresh.

RAM Address Enable Input: At all times the status of the address counter outputs is controlled externally by the Enable Input. Logic "0" = TRI-STATE, Logic "1" = Active.

Internal Top-of-Page, Row Start, and Cursor Registers: Control pins are provided for loading the top-of-page, row start, and cursor address into three 12-bit CRTC registers from the bidirectional memory address pins.

The Top-of-Page Register (TOPR) holds the address of the first character of the first video row. This register allows display scroll with the CRTC without the use of external memory address adders. If the TOPR is not loaded after a system clear its contents will be zero and the address outputs will be sequential from zero at the top-of-page.

The Cursor Register (CR) holds the present address of the cursor and is cleared to zero after a system clear. Once the TOPR and CR registers have been loaded they need not be accessed again until modification of their contents is required. These registers may be loaded at any time, but to cause minimum display distortion it is recommended that they be loaded only during blanking intervals.

The Row Start Register (RSR) is the working register for the CRTC address counter. It determines the first video character address on a scan line to scan line basis.

Modification of this register after the start of video in a scan line will modify the address counter outputs at the start of video on the next scan line. (See address output description.) If the RSR is never externally loaded, the CRTC address outputs will be sequential on a row-to-row basis from the TOPR contents at the start of the video page. With external loading, row-to-row non-sequential operation of the CRTC address outputs is possible, thus row-to-row edit capability. When used in this mode the RSR should be loaded after the start of video time of the last scan line of the previous row. A load to the RSR during vertical blanking will also load the TOPR.

Table 2. Register Load Truth Table

Register Select A	Register Select B	Register Load Input	Register Access
0	0	0	No Select
0	1	0	Top-of-Page
1	0	0	Row Start*
1	1	0	Cursor
X	X	1	No Select

*During vertical blanking a load to this register will also load the top-of-page register.

VIDEO RELATED OUTPUTS

Horizontal Sync: This output provides the necessary line (scan) rate sync to either three-terminal or composite sync monitors. The pulse is programmable in position and width at character time increments. This output may also be programmed to have RS-170 compatible serration pulses during the vertical sync interval. The active logic state of this output is also programmable.

Vertical Sync: This output provides the necessary frame rate sync consistent with either three-terminal or composite type monitors. The pulse is programmable in position and width at line (scan) time increments. The active logic state of this output is also programmable.

Cursor Enable: When a match with the CRTC cursor address register and address counter occurs a pulse will appear at this output at that video character time (character field width) for every line in that row. This output may also be programmed to appear on only one line of a character row. With the character generator program pin in a logic "0" position the cursor enable output will not be valid on the last line of a character row for that row. Like the Load Video Shift Register Output, this output is not active during horizontal or vertical blanking. High level active output.

CRT SYSTEM CONTROL FUNCTIONS

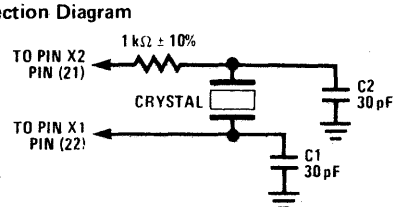
50/60 Hz Control Input: This input controls the CRT system refresh rate. The CRTC may also be programmed for refresh rates other than 50 and 60 Hz.

50/60 Hz Control	Refresh Rate
1	60 Hz (f_1)
0	50 Hz (f_0)

Vertical Blanking Output: This output becomes active (logic "1") at the start of vertical blanking and may be programmed to stop at the end of any line of the character row before the start of the first video row. This output is useful for flag applications to other elements in the CRT system. Its active level is also programmable.

System Clear Input: This input when low sets and holds the CRTC at the start of vertical blanking for system sync and test. It also clears to zero the cursor and top-of-page registers. The input has hysteresis and may be connected to a resistor to V_{CC} and a capacitor to ground to provide power-up system clear.

Character Generator Program Input: This input modifies both the position of the recirculate enable output low level and the time at which the address outputs change to a new row address. It is intended to provide optimum use of the CRTC with character generator/ROMs programmed with or without active video on the first or last line of a character row. (See Recirculate Enable for truth table.)



External Character/Line Rate Clock: This input is intended to aid testing of the CRTC and is not meant to be used as an active input in a CRT system. When this input is left open it is guaranteed not to interfere with normal operation.

Crystal Inputs X1 and X2: The oscillator is controlled by an external, parallel resonant crystal connected between the X1 and X2 pins. Normally, a fundamental mode crystal is used to determine the operating frequency of the oscillator; however, overtone mode crystals may be used.

Crystal Specifications (parallel resonant):

Type . . . . . AT-Cut Crystal
Tolerance . . . . . 0.005% at 25°C
Stability . . . . . 0.01% from 0°C to +70°C
Resonance . . . . . Fundamental (parallel)
Maximum Series Resistance . . . . . Dependent on frequency (for 10.92 MHz, 50 Ω)
Load Capacitance . . . . . 20 pF

Connection Diagram

If the DP8350 series is clocked at dot rate by a system clock, pin 22 (X1 input) should be clocked directly using a Schottky series circuit. Pin 21 (X2 input) may be left open.

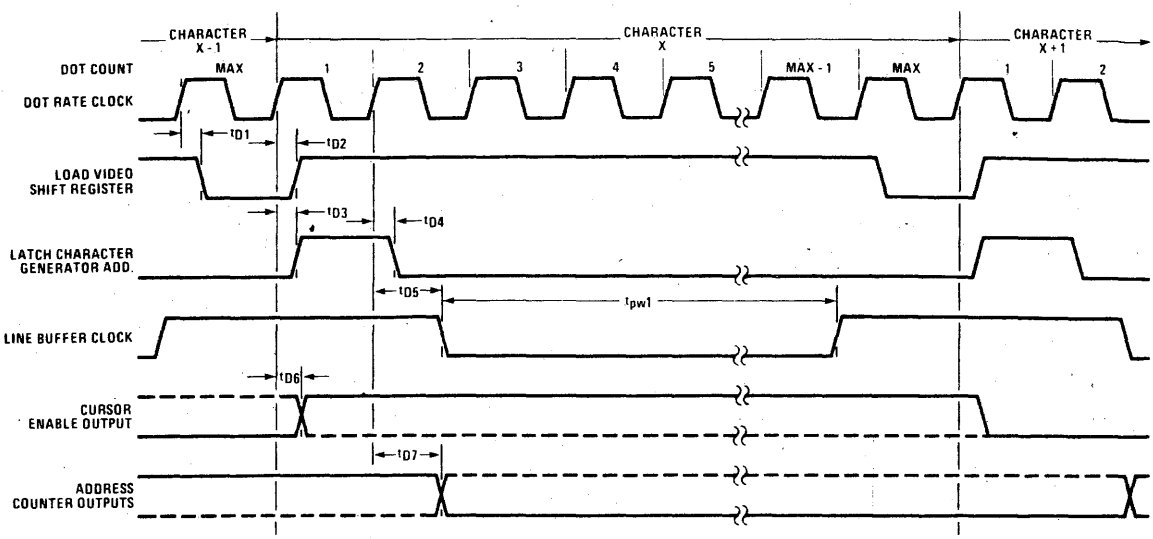
Timing Waveforms



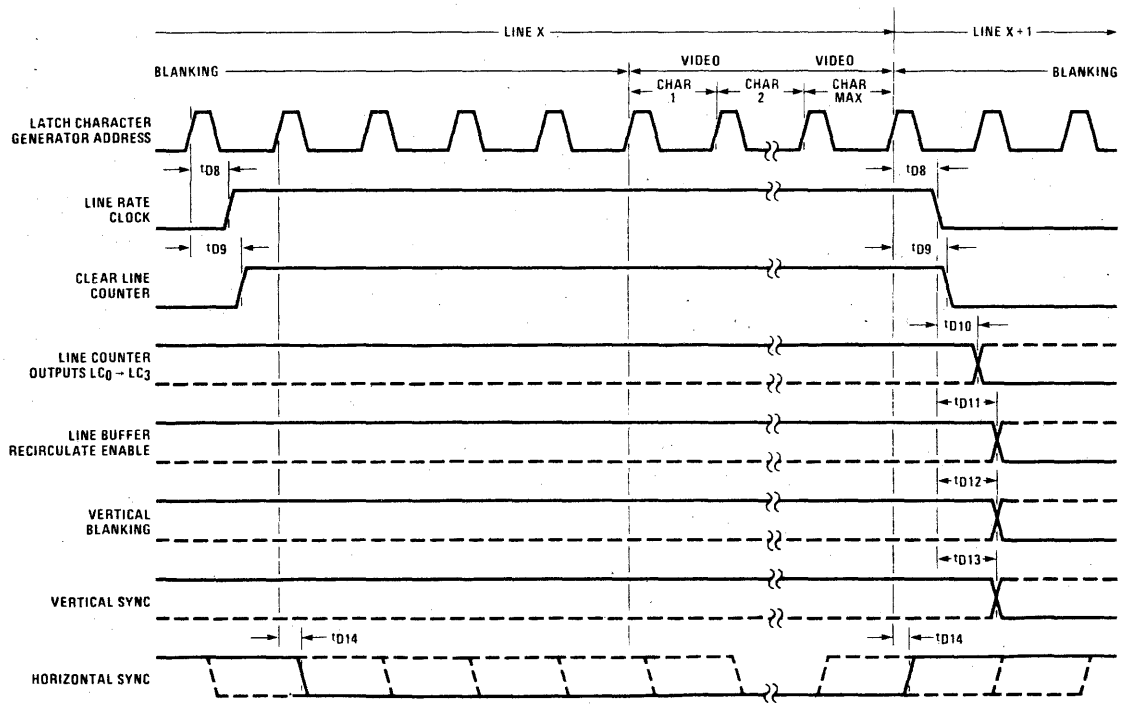


Figure 1. Dot/Character Rate Timing

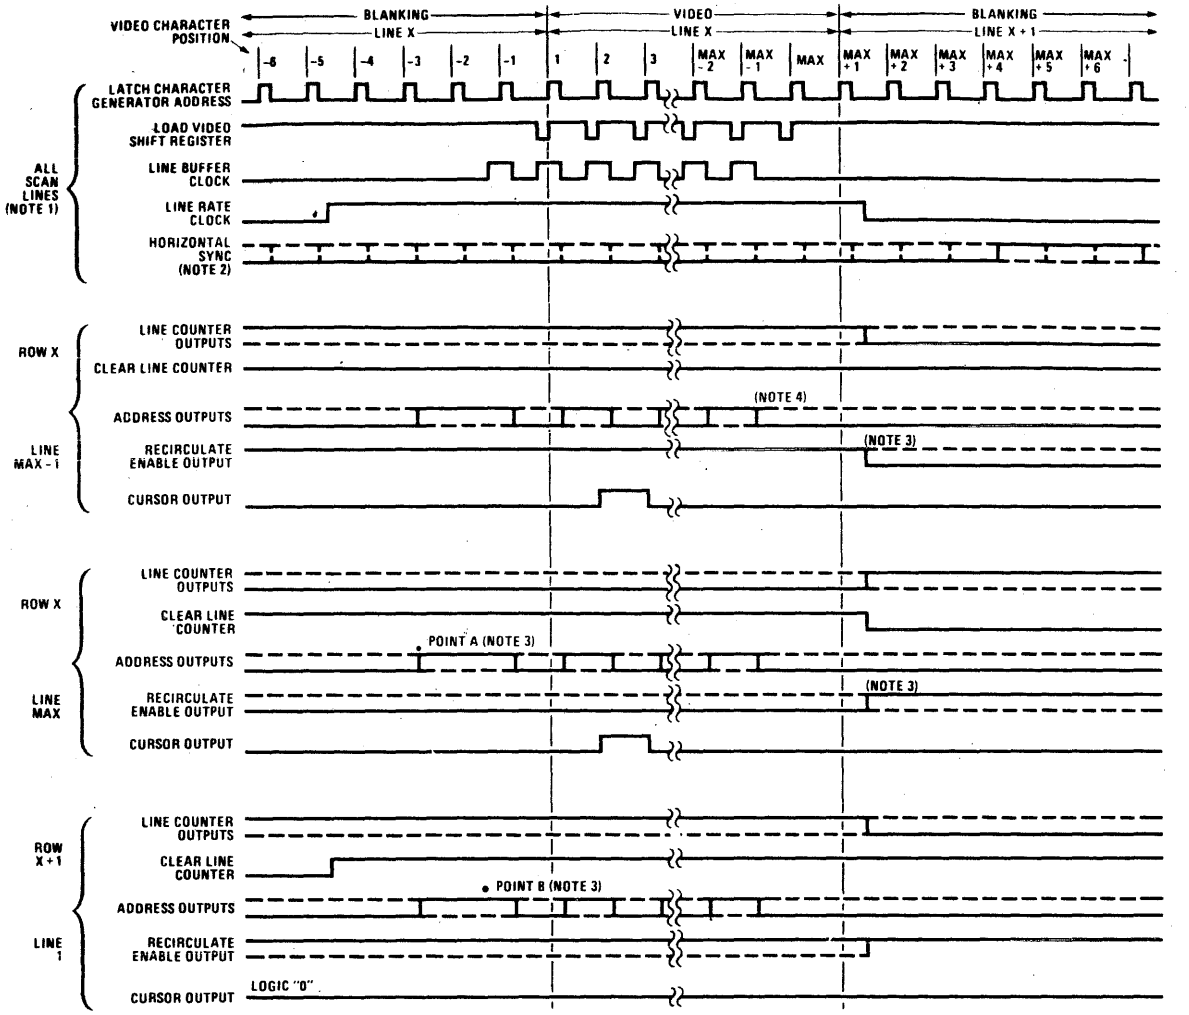


*THE POSITION OF THE START AND STOP POINTS OF THE HORIZONTAL SYNC PULSE ARE PROGRAMMABLE BY CHARACTER TIME – WITHIN ONE CHARACTER TIME THE POINTS WILL HAVE THE t_{D14} TIME RELATIONSHIP.

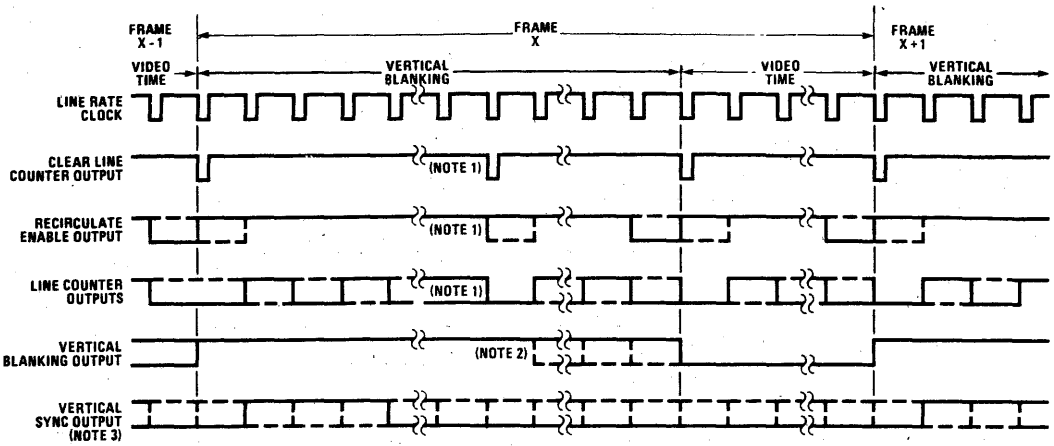
Figure 2. Character/Line Rate Timing

©IC MASTER 1979

Timing Waveforms (cont'd.)

Note 1: The load video shift register output is not active during vertical or horizontal blanking (remains in the logic "1" state during these intervals.

Note 2: The horizontal sync output start and stop point positions are user-programmable at character width intervals.



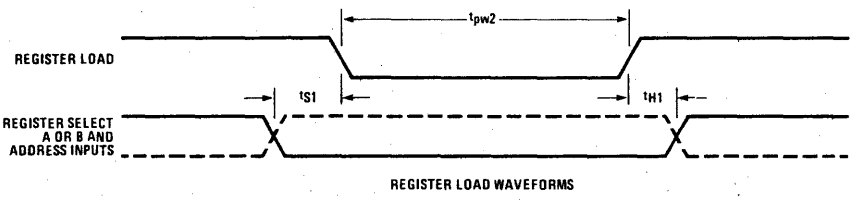
Note 3: The position of the recirculate enable output logic "0" level is dependent on the state of the character generator program input (CGPI). With CGPI = "0," recirculate enable occurs on the max line of a character row (solid line) and the address counter outputs roll over to the new row address at point A. With CGPI = "1," recirculate enable occurs on the first line of a character row (dashed line) and the address counter outputs roll over to the new row address at point B.

Note 4: The address counter outputs clock to the address of the last character of a video row plus 1. This address is then held during the horizontal blanking interval until video minus three character times. At this point the outputs are modified to the contents of the Row Start Register (RSR). With no external loading of the RSR the contents will be either the character address of the first character in the present row or the character address of the first character of the next video row (depending on the state of the Character Generator Program input) which will be sequential from the last character address of the last row. If the RSR was loaded, then the address outputs will be modified to the contents of the register.

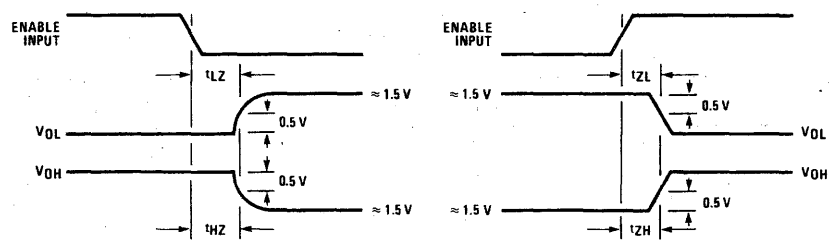
Figure 3. Character/Line Rate Functional Diagram

©IC MASTER 1979

Timing Waveforms (cont'd.)



Note 1: One full row before start of video the line counter is set to zero state — this provides line counter synchronization in cases where the number of lines in vertical blanking are not even multiples of the number of lines per row.



Note 2: The stop point of vertical blanking is programmable at line intervals within the last character row before start of video.

Note 3: The Vertical Sync Output start and stop points are programmable at line rate increments.

Note 1: Unless otherwise specified, all AC measurements are referenced to the 1.5V level of the input to 1.5V of the output.

Note 2: When external clock inputs are used, the input characteristics are Z_{OUT} = 50Ω and $t_R \leq 10$ns, $t_F \leq 10$ns.

*"DT" is defined as the duration (in ns) of one full cycle of the Dot Rate Clock (Item 20 of the ROM Program Table). "N" denotes the number of DTs per definition in Item 24 of the ROM Program Table.

DP8350 Series Option Program Table (Notes 1, 2, and 3)

Item No.	Parameter		Value	
1	Character (Font Size)	Dots per Character		
2		Scan Lines per Character		
3	Character Field (Block Size)	Dots per Character		
4		Scan Lines per Character		
5	Number of Video Characters per Row			
6	Number of Video Character Rows per Frame			
7	Number of Video Scan Lines (Item 4 x Item 6)			
8	Frame Refresh Rate (Hz) (two frequencies allowed)		f1 =	f0 =
9	Delay after/before Vertical Blank start to start of Vertical Sync (+/– Number of Scan Lines)			
10	Vertical Sync Width (Number of Scan Lines)			
11	Delay after Vertical Blank start to start of Video (Number of Scan Lines)			
12	Total Scan Lines per Frame (Item 7 + Item 11 = Item 13 ÷ Item 8)			
13	Horizontal Scan Frequency (Line Rate) (kHz) Item 8 x Item 12)			
14	Number of Character Times per Scan Line			
15	Character Clock Rate (MHz) Item 13 x Item 14)			
16	Character Time (ns) (1 ÷ Item 15)			
17	Delay after/before Horizontal Blank start to Horizontal Sync Start (+/– Character Times)			
18	Horizontal Sync Width (Character Times)			
19	Dot Frequency (MHz) (Item 3 x Item 15)			
20	Dot Time (ns) (1 ÷ Item 19)			
21	Vertical Blanking Stop before start of Video (Number of Scan Lines) (Range = Item 4 – 1 line to 0 lines)			
22	Cursor Enable on all Scan Lines of a Row? (Yes or No) If not, which Line?			
23	Does the Horizontal Sync Pulse have Serrations during Vertical Sync? (Yes or No)			
24	Width of Line Buffer Clock logic "0" state within a Character Time (Number of Dot Time increments)			
25	Serration Pulse Width, if used (Character Times)			
26	Horizontal Sync Pulse Active state logic level (1 or 0)			
27	Vertical Sync Pulse Active state logic level (1 or 0)			
28	Vertical Blanking Pulse Active state logic level (1 or 0)			

Note 1: If the Cursor Enable, Item 22, is active on only one line of a character row, then Item 21 must be either "1" or "0" unless it is the same as the line selected for Cursor Enable.

Note 2: Item 24 x Item 20 should be > 250 ns.

Note 3: Item 11 must be greater than Item 4 + 1.

DP8350 Series Option Program Table

DP8350 Option: 80 Characters x 24 Rows, 5 x 7 Character Font, 7 x 10 Character Field

Item No.	Parameter		Value	
1	Character (Font Size)	Dots per Character	5	
2		Scan Lines per Character	7	
3	Character Field (Block Size)	Dots per Character	7	
4		Scan Lines per Character	10	
5	Number of Video Characters per Row		80	
6	Number of Video Character Rows per Frame		24	
7	Number of Video Scan Lines (Item 4 x Item 6)		240	
8	Frame Refresh Rate (Hz) (two frequencies allowed)		f1 = 60 Hz	f0 = 50 Hz
9	Delay after/before Vertical Blank start to start of Vertical Sync (+/– Number of Scan Lines)		4	30
10	Vertical Sync Width (Number of Scan Lines)		10	10
11	Delay after Vertical Blank start to start of Video (Number of Scan Lines)		20	72
12	Total Scan Lines per Frame (Item 7 + Item 11 = Item 13 ÷ Item 8)		260	312
13	Horizontal Scan Frequency (Line Rate) (kHz) Item 8 x Item 12)		15.6 kHz	
14	Number of Character Times per Scan Line		100	
15	Character Clock Rate (MHz) Item 13 x Item 14)		1.56 MHz	
16	Character Time (ns) (1 ÷ Item 15)		641 ns	
17	Delay after/before Horizontal Blank start to Horizontal Sync Start (+/– Character Times)		0	
18	Horizontal Sync Width (Character Times)		43	
19	Dot Frequency (MHz) (Item 3 x Item 15)		10.920 MHz	
20	Dot Time (ns) (1 ÷ Item 19)		91.6 ns	
21	Vertical Blanking Stop before start of Video (Number of Scan Lines) (Range = Item 4 – 1 line to 0 lines)		1	
22	Cursor Enable on all Scan Lines of a Row? (Yes or No) If not, which Line?		Yes	
23	Does the Horizontal Sync Pulse have Serrations during Vertical Sync? (Yes or No)		No	
24	Width of Line Buffer Clock logic "0" state within a Character Time (Number of Dot Time increments)		4	
25	Serration Pulse Width, if used (Character Times)		–	
26	Horizontal Sync Pulse Active state logic level (1 or 0)		1	
27	Vertical Sync Pulse Active state logic level (1 or 0)		0	
28	Vertical Blanking Pulse Active state logic level (1 or 0)		1	

FULL/HALF ROW CONTROL (PIN 5)

Device pin 5 converts the DP8350 programmed display from 80 characters by 24 rows to 80 characters by 12 rows.

Full/Half Row (Pin 5) Logic State	Display Size
1	80 by 24
0	80 by 12

With pin 5 in logic "0" state, the 12 character rows are equally spaced vertically on the CRT. Each row is spaced by one full row of blanked video.

Also in this mode the address counter outputs address the same memory space for two rows – the video row and the blanked row. Thus one half of the CRT memory space is addressed with pin 5 in logic "0" state as compared to pin 5 in logic "1" state.

NE580-F,N

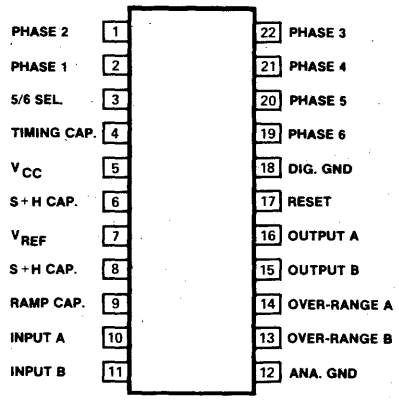
DESCRIPTION

The NE580 is a dual bar-graph logic circuit designed to provide all the functions necessary to drive a gas discharge self-scan ™ bar-graph panel. The NE580 is configured to drive a 201 element bar-graph in either 5 or 6 phase operation. Phase number selection is obtained by applying a logic 0 or 1 level to the phase select pin. 3 phase operation for a 101 element device can be attained by a wire-or connection of adjacent cathode phase outputs.

The device inputs accept an analog voltage in the range 0 to 2.5V and performs an A/D conversion with reference to a fixed input voltage at the reference terminal. On-chip functions include a clock generator, linear ramp generator, control logic and ROM decoding. Output functions comprise 2 anode control lines, 2 overrange indication outputs, 6 cathode phase outputs and 1 cathode reset output. Refer to the system block diagram for clarification.

A minimum of external components are required for the whole conversion and display system shown in the typical application. The NE580 can be expanded to handle more analog channels using external comparators. Either LM393A or LM339A type comparators will function well. A few external low-cost logic packages can in addition provide binary or BCD encoded data to interface with a logic control system.

The device is supplied in a 22-pin plastic molded or ceramic dual-in-line package.



™-self-scan is a trademark of Burroughs Corporation.

FEATURES

- **Dual channel device**
- **Easily expandable to handle more channels.**
- **Single 5 volt supply**
- **3, 5 or 6 phase operation**
- **Can be custom masked for different cathode segment counts, (maximum 240)**
- **Equivalent 8-bit resolution of displayed information.**
- **Overrange indication outputs.**

I_{BREF}	Bias current at reference voltage input	$V_{REF} = 2.5V$		500		nA
i_{IB}	Bias current at analog input	$V_{REF} = 2.5V$, $V_{IN} = 0V$		500		nA
$V_{OUT\ (1)}$	All outputs[2]	$I_{OUT} = -500\mu A$		3.5		V
$I_{OUT\ (1)}$	All outputs[2]	$V_{OUT} = 1.5V$		-1.0		mA
$I_{OUT\ (sc)}$	All outputs[2]	$V_{OUT} = 0V$		-1.5		mA
$V_{OUT\ (0)}$	All outputs	$I_{SINK} = 1.6mA$			0.4	V
F_C	Clock generator frequency	Timing capacitor $= .022\mu F$		25		KHz
Accuracy		$2V \leq V_{REF} \leq 2.5V$, $V_{IN} = V_{REF}$		±1		bar
I_{CC}	Supply current			50		mA

NOTES

1. Displayed accuracy is a function of reference voltage. Values of V_{REF} below 2 volts will impair conversion accuracy.
2. All logic outputs comprise an NPN transistor with 3kΩ pull-up resistor to 5 volts.

NE590-F,N • NE591-F,N

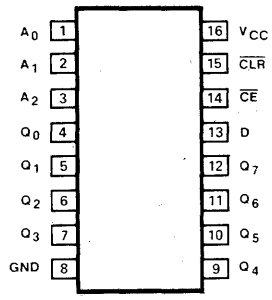
DESCRIPTION

The NE590/591 addressable peripheral drivers are high current latched drivers, similar in function to the 9334 address decoder. The device has 8 Darlington power outputs, each capable of 250mA load current. The outputs are turned on or off by respectively loading a logic high or logic low into the device data input. The required output is defined by a 3-bit address. The device must be enabled by a $\overline{CE}$ input line which also serves the function of further address decoding. A common clear input, $\overline{CLR}$, turns all outputs off when a logic low is applied.

The NE590 has 8 open collector Darlington outputs which sink current to ground. The device is packaged in a 16-pin molded or cerdip package.

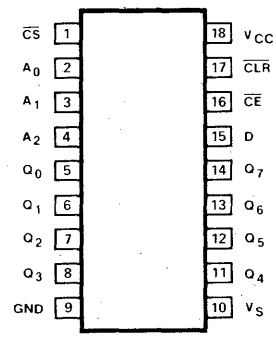
The NE591 has 8 open emitter Darlington outputs which source current to an external load from a common collector line, V_S. This V_S line need not necessarily be the same as the 5 volt V_{CC} supply. The device is packaged in an 18-pin molded or cerdip package.

FEATURES



- **8 high current outputs**
- **Low-loading bus compatible inputs**
- **Power-on clear ensures safe operation**
- **NE590 will operate in addressable or demultiplex mode**
- **Allows random (addressed) data entry**
- **Easily expandable**
- **NE590 is pin compatible with 9334**

APPLICATIONS



- **Relay driver**
- **Indicator lamp driver**
- **Triac trigger**
- **LED display digit driver**
- **Stepper motor driver**

PIN CONFIGURATIONS

NE590
F,N PACKAGE

NE591
F,N PACKAGE

PIN DESIGNATION

590 PIN NO.	591 PIN NO.	SYMBOL	NAME & FUNCTION
1-3	2-4	A_0-A_2	A 3-bit binary address on these pins defines which of the 8 output latches is to receive the data.
4-7, 9-12	5-8, 11-14	Q_0-Q_7	The 8 device outputs. The NE590 has open collector Darlington outputs. The NE591 has open emitter follower outputs.
13	15	D	The data input. When the chip is enabled, this data bit is transferred to the defined output such that: "1" turns output switch "ON" "0" turns output switch "OFF" Thus in logic terms, the NE590 inverts data to the relevant output. The NE591 retains true data at the output.
14	16	$\overline{CE}$	The chip enable. When this input is low, the output latches will accept data. When $\overline{CE}$ goes high, all outputs will retain their existing state, regardless of address or data input conditions.
15	17	$\overline{CLR}$	The clear input. When $\overline{CLR}$ goes low all output switches are turned "OFF". On the NE590, a high data input will override the clear function on the addressed latch. On the NE591, $\overline{CLR}$ low will override any other condition.
—	1	$\overline{CS}$	The chip select input provides for an additional level of address decoding.
—	10	V_S	The V_S line provides the power to all 8 output devices. It is connected to the collectors of all 8 output transistors. This pin may be connected to the V_{CC} or another supply.

©IC MASTER 1979

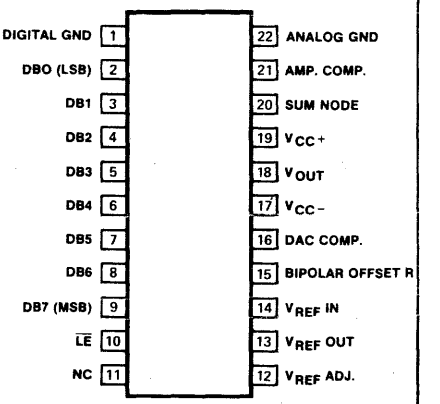
DESCRIPTION

The NE5018 is a complete 8-bit digital to analog converter subsystem on one monolithic chip. The data inputs have input latches, controlled by a latch enable pin. The data and latch enable inputs are ultra-low loading for easy interfacing with all logic systems. The latches appear transparent when the $\overline{LE}$ input is in the low state. When $\overline{LE}$ goes high, the input data present at the moment of transition is latched and retained until $\overline{LE}$ again goes low. This feature allows easy compatibility with most micro-processors.

The chip also comprises a stable voltage reference (5V nominal) and a high slew rate buffer amplifier. The voltage reference may be externally trimmed with a potentiometer for easy adjustment of full scale, while maintaining a low temperature co-efficient.

The output of the buffer amplifier may be offset so as to provide bipolar as well as unipolar operation.

FEATURES



- **8-bit resolution**
- **Input latches**
- **Low-loading data inputs**
- **On-chip voltage reference**
- **Output buffer amplifier**
- **Accurate to ± 1/4 LSB (.1%)**
- **Monotonic to 8 bits**
- **Amplifier and reference both short-circuit protected**
- **Compatible with 2650,8080 and many other μP's**

APPLICATIONS

- **Precision 8-bit D/A converters**
- **A/D converters**
- **Programmable power supplies**
- **Test equipment**
- **Measuring instruments**
- **Analog-digital multiplication**

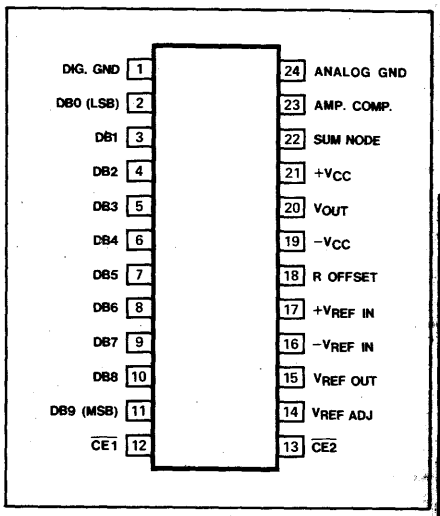
10-BIT μP-COMPATIBLE D/A CONVERTER — NE 5020

DESCRIPTION



The NE5020 is a 10-bit voltage output D/A converter similar in design to the NE5018 8-bit DAC. The chip incorporates an R-2R ladder, input data latches, a voltage reference and an output operational amplifier. The divice can be configured for either unipolar or bipolar operation.

The 10 bits of digital data may be loaded into the latches simultaneously or as 2 bits of 2 and 8 bits respectively. $\overline{CE1}$ latches the 2 most significant bits. $\overline{CE2}$ latches the 8 least significant bits. $\overline{CE1}$ and $\overline{CE2}$ are tied together to load 10 bits in parallel. When loading from an 8 bit data bus $\overline{CE1}$ and $\overline{CE2}$ are controlled separately, and the 2 MSBs may be paralleled with any 2 of the least 8 significant bits.

FEATURES

- **10-bit resolution**
- **±0.05% accuracy**
- **Monotonic to 10-bits**
- **Unipolar (0 to 10V) and bipolar (−5 to +5V) operation**
- **10-bit data can be loaded from 8-bit data bus.**
- **Settling time - 5μs**
- **Latch enable pulse width 200ns minimum.**

Signetics

ANALOG TO DIGITAL CONVERTER — NE5034

PRELIMINARY SPECIFICATIONS

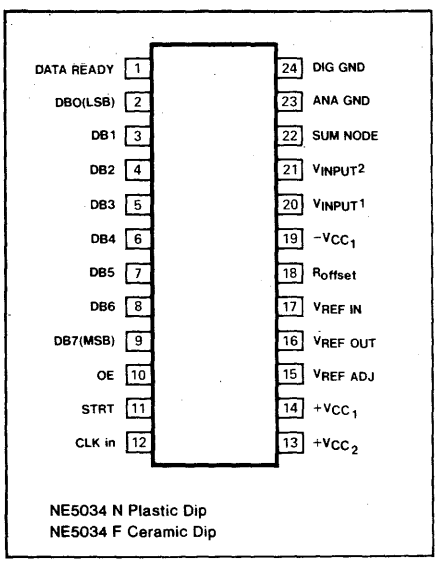
NE5034-N,F

DESCRIPTION

The 5034 is an 8-bit resolution analog-to-digital converter. The circuitry is arranged to provide maximum design flexability.

The 5034 contains all of the elements comprising a true 8-bit accuracy analog-to-digital converter on one monlithic chip. These elements include the internal logic, voltage reference, comparator, clock, and output buffers. The output buffers are microprocessor addressable for bus compatibility.

The 5034 achieves fast conversion time (17μsec, Typ) using a single external capacitor to set the internal clock frequency. Faster conversion times are possible using an external clock.



FEATURES

- **8-bit resolution and accuracy**
- **Micro-processor compatible logic**
- **Internal clock with external override for higher speed**
- **Pin programmable unipolar and bipolar inputs**
- **No missing codes over full operating temperature range**
- **System flexibility**

APPLICATIONS

- **A/D converters in micro-processor based systems**
- **High speed A/D systems**
- **Ratiometric A/D conversion**
- **Automated process controls**
- **Low cost A/D systems**

NE5034 N Plastic Dip
NE5034 F Ceramic Dip

SE5118-F • NE5118-N

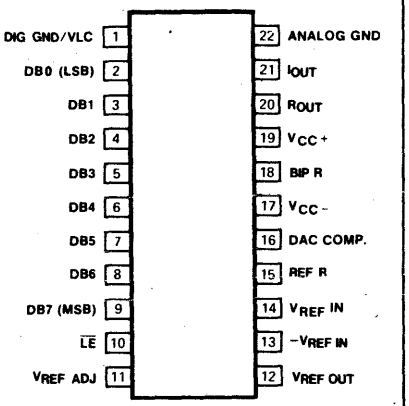
DESCRIPTION

The NE5118 is a high-speed 8-bit digital to analog converter subsystem on one monolithic chip. The data inputs have input latches, controlled by a latch enable pin. The data and latch enable inputs are ultra-low loading for easy interfacing with all logic systems. The latches appear transparent when the $\overline{LE}$ input is in the low state. When $\overline{LE}$ goes high, the input data present at the moment of transition is latched and retained until $\overline{LE}$ again goes low. This feature allows easy compatibility with most microprocessors.

The chip also comprises a stable voltage reference (5V nominal). The voltage reference may be externally trimmed with a potentiometer for easy adjustment of full scale, while maintaining a low temperature co-efficient.

The output has high voltage compliance increasing versatility.

FEATURES



- 8-bit resolution
- Input latches
- Low-loading data inputs
- On-chip voltage reference
- Fast settling output current—200ns
- Accurate to ± 1/4 LSB
- Monotonic to 8 bits
- Reference short-circuit protected
- Compatible with 2650, 8080 and many other μP's

APPLICATIONS

- Precision 8-bit D/A converters
- A/D converters
- Programmable power supplies
- Test equipment
- Measuring instruments
- Analog-digital multiplication
- CRT display drivers
- High-speed modems

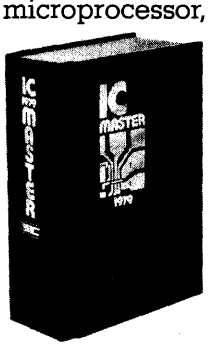
"I need to know if this device exists, and if there are any alternate sources. Where do I start?"

- Memory IC
- RAM
- Static
- 1024x1
- CMOS
- 250 Nanoseconds
- 5 Volts

If you're spending hours to solve a problem similar to the one above, you're behind the times...



It only takes a few seconds with "THE MASTER."

Clear your desk for action with the newly revised 1979 IC Master. Its all-under-one-cover features include: Over 40,000 standard products from more than 87 different companies. . . five different selection guides (memory, microprocessor, interface, linear and digital.) . . . alternate source directory for pin- for- pin, function- for- function replacements . . . applications directory. . . complete military section . . . a complete part numbering guide . . . etc.

You don't have to search through stacks of catalogs. Simply look up the specs and function you need. You don't need a part number to start with.

All you need is a problem to use The Master. Does the device exist? Who makes it? Is there an alternate source? What's the part number? Is there an applications note? Who is my closest distributor—etc.

PMOS Medium Speed Analog Switches

DGM111	2XSPST	DG170	3XSPDT
DG116	4XSPST	DG171	SPST
DGM122	2XDPST	DG172	4XSPST
DG123	5XSPST	DG173	DPDT
DG125	5XSPST	DG175	SPDT

This series of analog switches contains 1-5 SPST functions as well as DPST, DPST, and DPDT functions. These switches interface with TTL/DTL logic.

- Analog Range ±10 V
- ON Resistance 50-450 Ω
- OFF Leakage 100 pA

TTL/DTL Compatible N-Channel Junction FET Analog Switches

DG126 through DG164

This series of analog switches includes SPST, DPST, and DPDT functions with low to medium ON resistance, constant over the analog voltage range, and medium speed.

- ON Resistance 10-80 Ω
- OFF Leakage 100 pA
- Standby Power 1 mW
- Analog Voltage Range ±10 V
- t_{ON} 600 nsec
- t_{OFF} 1.2 μsec

High Speed, High Frequency, DTL/TTL Compatible N-Channel Junction FET Analog Switches

DG180 through DG191

These switches feature very high switching speeds, high frequency signal handling capabilities, and constant ON resistance over analog voltage range.

- Analog Voltage Range ±10 V
- Break-Before-Make ±7.5 V
- t_{ON} 150 nsec
- t_{OFF} 100 nsec
- Signal Frequency Range 100 MHz

Medium Speed CMOS Switches and Analog Multiplexers

DG200	2XSPST
DG201	4XSPST
DG506	16 Channel MUX
DG507	8 Channel Diff. MUX
DG508	8 Channel MUX
DG509	4 Channel Diff. MUX

This series of CMOS switches features medium speed, low priced CMOS switches with voltage handling capabilities of ±15 V.

- V_{ANALOG} ±15 V
- Leakage 200 pA

High Speed, Low Power, Low R_{ON} CMOS Analog Switches

DG300-304-381	2XSPST
DG301-305-387	1XSPDT
DG302-306-384	2XDPST
DG303-307-390	2XSPDT

The DG300 series is a new group of CMOS devices featuring high speed, low R_{ON}, low power and ±15 V signal handling capabilities. DG300-309 have TTL/DTL/CMOS compatible inputs. DG304-307 have MOS compatible inputs and feature higher speed and lower power.

- R_{ON} 50 Ω
- t_{ON} 150 (TTL) 110 (CMOS)
- t_{OFF} 130 (TTL) 70 (CMOS)
- Power 5 μW (TTL) 1 μW (CMOS)
- Signal Frequency Range 100 MHz

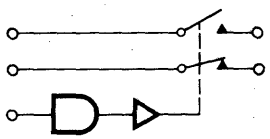
DG503

Low cost 8 channel multiplexer.

©IC MASTER 1979



Siliconix drivers and associated FET switches are available as single-package integrated circuits. They are intended for applications where the switched analog signal must be isolated from the driving source and associated power supplies. Designs include monolithic devices with bipolar and Schottky transistors and MOSFETs on a single chip; monolithic CMOS switches and multiplexers; and multichip hybrids which combine discrete junction FET chips and a common driver in one package. The accompanying switch diagrams display a wide variety of switch functions. The devices shown in **boldface** are recommended parts for new designs.

NOTES:

1. Current Driven Device – I_{INH} = 1 mA
2. The appropriate switching characteristic for multiplexers is $t_{TRANSITION}$, not t_{ON}, t_{OFF}.
3. V_{REF} = 1.5 V is used when supply voltages < ±15 V are used. Not needed when supply voltages of ±15 V are used.
4. Analog voltage range is a function of supply voltages. Where a FET switch is PMOS or CMOS, r_{DS} is also a function of Supply Voltage and Analog Voltage. See individual data sheets for more detail. Values shown are for temperature suffix A.
5. Device normally operates with resistor to +10 V.

Monolithic CMOS Analog Switches

designed for . . .

- **Portable, Battery Operated Circuits**
- **Low Leakage Switching i.e. Sample and Hold Circuits**
- **Communication Systems**
- **Low Level Switching Circuits**
- **Fast Switching Circuits such as Multiplexers**
- **Standard Linear Dual Supply Voltages or Single Supply Systems**

BENEFITS

- **Low Standby Power**
  - 0.06 μW Typical
- **Minimizes Signal Error**
  - 0.1 nA Typical Leakage
- **Low Operating Power**
  - 0.06 μW Typical for DG304-407
- **Reduced Voltage Drop Across Switch in ON Condition**
  - $r_{ds(on)} < 50\ \Omega$
- **Minimizes Switching Time**
  - Typ t_{on} & $t_{off} < 200$ ns
- **Minimizes System Power Requirements**
  - Single Supply Operation Capabilities
- **Easily Interfaced**
  - TTL, DTL and CMOS Input Compatible
- **Reduces External Component Requirements**
  - Logic Input Overvoltage Protection

DESCRIPTION

The DG300 through DG307 switch family features four switching functions using CMOS technology for low and nearly constant ON resistance (less than 50 Ω) over the full analog signal range. In the ON condition the switches will conduct current in either direction with no offset voltage. With low power dissipation, (a few milliwatts for the DG300-303, a few hundred microwatts for the DG304-307), this series of switches becomes an ideal candidate for battery-powered or remote switching applications. The switching speed is among the fastest available with the low quiescent power dissipation. In the OFF condition, the switches will block voltages up to 30 V peak-to-peak. A logic input driver controls the ON/OFF state of the switches. (See the "Pin Configuration" for switch status with a logic "1" input.) The DG300-303 switches are TTL and CMOS input compatible and have a logic "0" state with an input less than 0.8 V and a logic "1" state with an input greater than 4.0 V. A pull-up resistor should be added for totem pole TTL outputs. The DG304-307 switches are CMOS input compatible and have a logic "0" state with an input less than 3.5 V and a logic "1" state with an input greater than 11 V (for 15 V positive supply). The logic inputs are protected against overvoltage up to 18 V above and 36 V below the positive supply. The combination of low cost, low power, low resistance and fast speed optimizes system design.

DESCRIPTION

The DG381 through DG390 switch family features four switching functions using CMOS technology for low and nearly constant ON resistance (less than 50 Ω) over the full analog signal range. In the ON condition the switches will conduct current in either direction with no offset voltage. With low power dissipation, a few milliwatts, this series of switches becomes an ideal candidate for battery-powered or remote switching applications. The switching speed is among the fastest available with the low quiescent power dissipation. In the OFF condition, the switches will block voltages up to 30 V peak-to-peak. A logic input driver controls the ON/OFF state of the switches. (See the "Pin Configuration" for switch status with a logic "1" input.) The switches are TTL and CMOS input compatible and have a logic "0" state with an input less than 0.8 V and a logic "1" state with an input greater than 4.0 V. A pull-up resistor should be added for totem pole TTL outputs. The logic inputs are protected against overvoltage up to 18 V above and 36 V below the positive supply. The combination of low cost, low power, low resistance and fast speed optimizes system design.

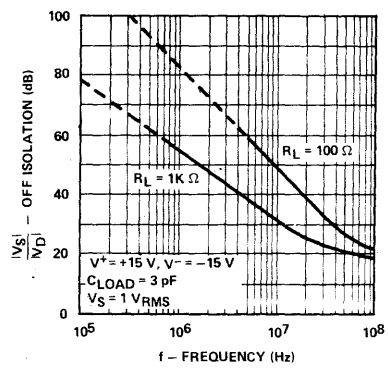
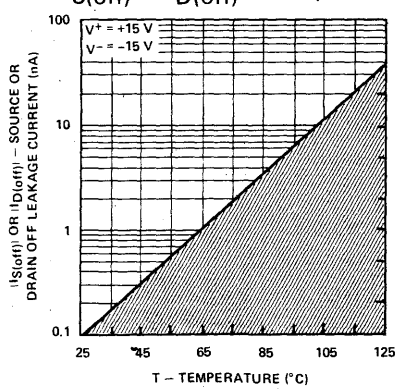
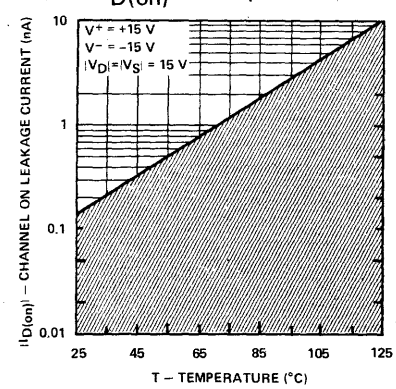
$r_{DS(on)}$ vs V_D and Power Supply Voltage



Device Power Dissipation vs Switching Frequency

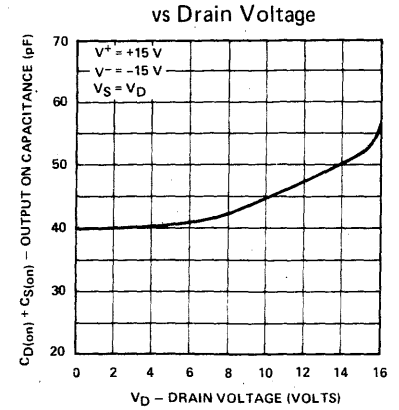


Single Logic Input

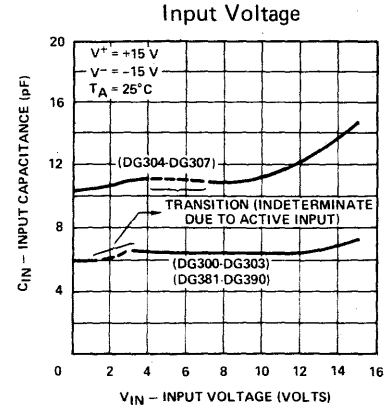


OFF Isolation vs Frequency

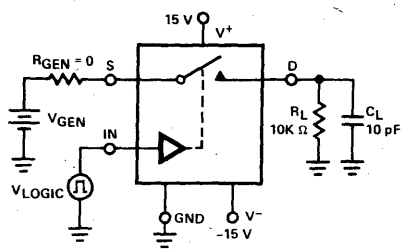
$I_{S(off)}$ or $I_{D(off)}$ vs Temperature*



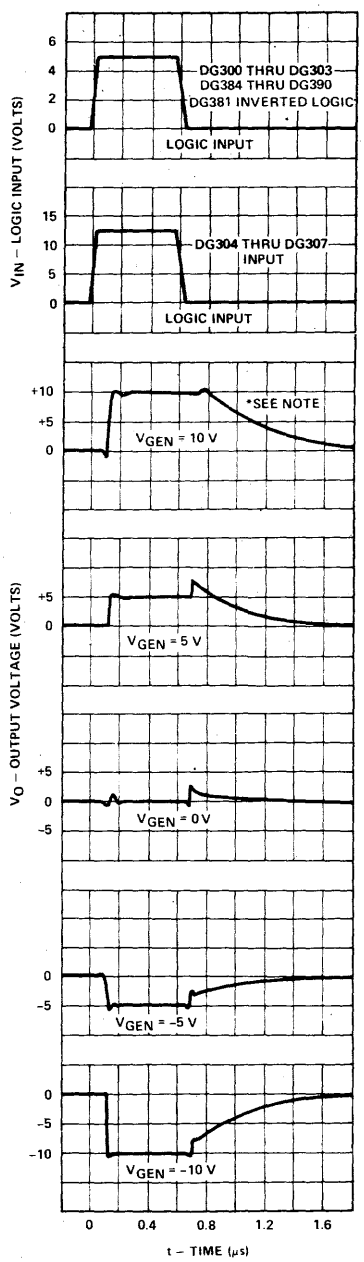
$I_{D(on)}$ vs Temperature*



*The net leakage into the source or drain is the n-channel leakage minus the p-channel leakage. This difference can be positive, negative, or zero depending on the analog voltage and temperature, and will vary greatly from unit to unit.



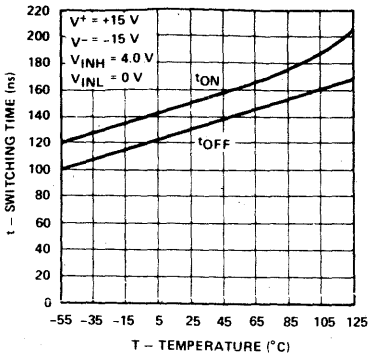
Output ON Capacitance vs Drain Voltage



Input Capacitance vs Input Voltage

Typical delay, rise, fall, settling times, and switching transients in this circuit.

If R_{GEN}, R_L or C_L is increased, there will be proportional increases in rise and/or fall RC times. Applying V_{GEN} to D rather than S results in much greater spikes.



*Note: The turn-off time is primarily limited here by the RC time constant (100 ns) of the load.

four digit LCD decoder driver

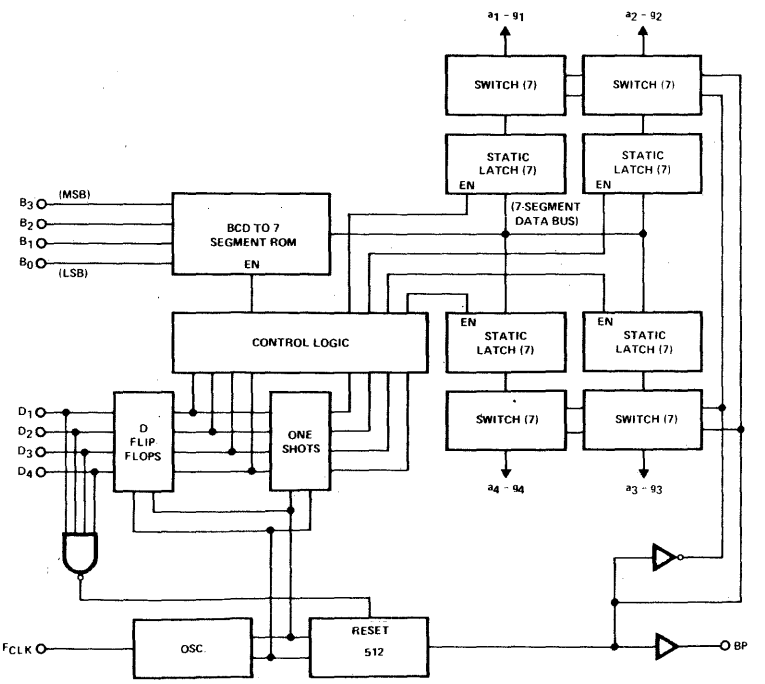
designed for . . .

■ Driving Liquid Crystal Displays Directly

BENEFITS

- Reduces Complexity of Driving LCD Displays
- Only 1 Package Required to Drive Up to a 4 Digit Display
- Minimal Power Consumption
  - Typically 1.5 mW
- Easily Interfaces with Most Logic Families
- No External Oscillator Required
- No Display Buffering Required
- Easy Multiple Driver Interfacing
- Eliminates DC Biases which Degrade Display Lifetime
- Blank Digital Code on Chip

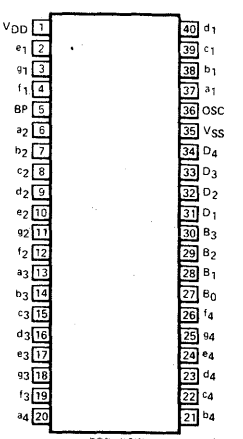
DESCRIPTION



The DF412 Four Digit LCD Decoder Driver is a CMOS Monolithic multiplexed BCD to LCD Decoder Driver. One DF412 contains all of the circuitry needed to decode up to 4 digits of multiplexed BCD information and derive the AC signals needed to drive a 4 digit LCD display.

An on board oscillator, its frequency being controlled by an external capacitor, develops a backplane (BP) signal which is a square wave swinging between ground (V_{SS}) and the positive supply (V_{DD}). Segment drivers supply square waves of the same frequency as the backplane but either in phase for an OFF segment or out of phase for an ON segment. In this manner of LCD digit driving the net DC voltage applied between segment and backplane is zero, a necessary requirement for long display life. Digital input levels are defined as input voltages > 5 V being a logic "1" and input voltages < 0.8 V being a logic "0" with V_{DD} = 6 V.

BCD input data is decoded into 7 segment form using an on board ROM. The 7 segment data is then latched into the appropriate static latches via the digit strobe inputs and control logic.



The pinout of the DF412 allows easy PC board interfaces to Dual In-Line LCDs as well as edge connecting types of displays.

± 3 digit A/D converter
± 3⅓ digit A/D converter

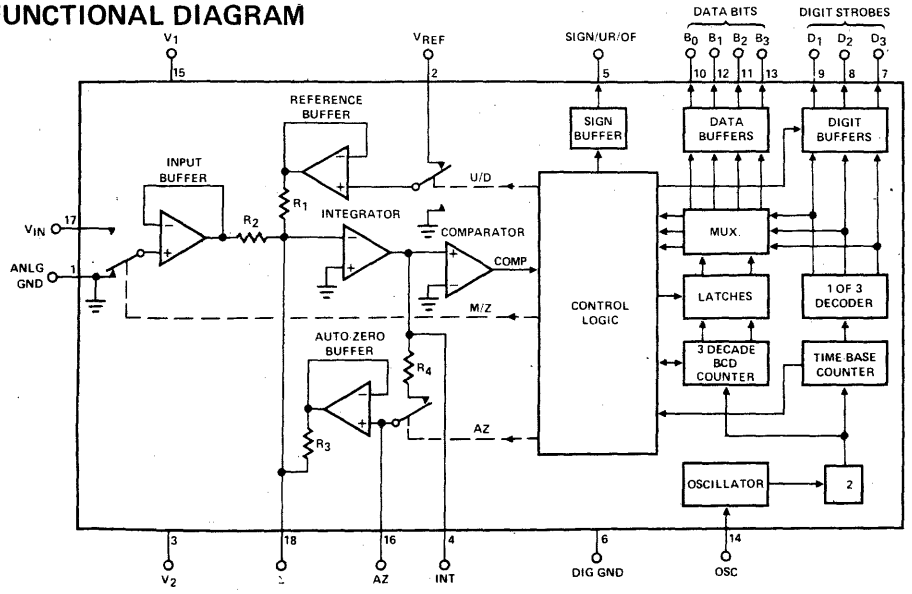
designed for . . .

- **Digital Voltmeters, Panel Meters**
- **Digital Thermometers**
- **General Instrumentation (Noise, Light, pH, etc.)**
- **Microprocessor Interfaces to Analog Signals**

BENEFITS

- Accuracy of 0.1% ±1 Count For Full Use of 3 Digits
- Low Power Consumption of 25 mW
- Minimum External Parts Count
- Auto-Zero and Auto-Polarity
- Buffered Signal and Reference Inputs ($Z_{IN} > 10^9\ \Omega$)
- Internal Oscillator Uses Only One External Capacitor
- Wide Sampling Range of 1 to 60/Second
- Multiplexed BCD Output For Simple Display and μ-P Interface

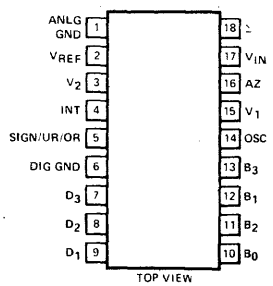
DESCRIPTION



The LD130 combines both the analog and digital subsystems of a 3 digit A/D system in a single monolithic CMOS I.C. The "Quantized Feedback" conversion scheme, introduced by Siliconix, provides the LD130 with an Auto-Zero, Auto-Polarity A/D system requiring only a single reference voltage. External parts are minimized by the on-chip resistors and buffer amplifiers. These high impedance input and reference buffer amplifiers eliminate source loading errors providing the outstanding temperature coefficient and ratio operation inherent in this system. Break-before-make switch action insures that neither the analog input nor the reference voltage will be shorted to ground at any time.

The LD130 3 digit A/D is made functionally complete by the following additions:

1. C_{AZ} (0.10 μF) between AZ and Σ pins
2. C_{INT} (0.033 μF) between INT and Σ pins
3. C_{OSC} (0.001 μF) between OSC and Digital Ground
4. $V_{REF} \cong 2.000$ V
5. ±5 V supplies (@ 3 mA)



The LD131 is functionally equivalent to the 3 digit LD130 A/D converter with the exception of not having overrange blinking when the count exceeds 999.

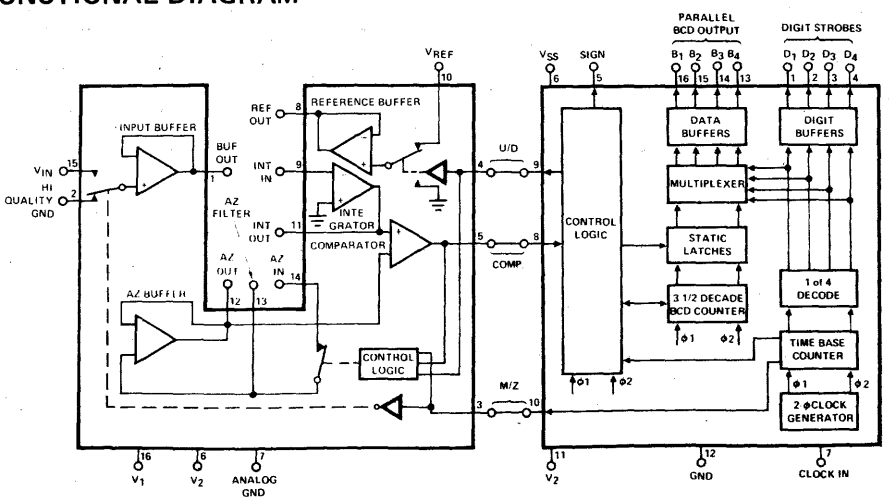
3½ digit A/D converter set

designed for . . .

- **High Performance Digital Voltmeters**
- **Digital Panel Meters**
- **Digital Instrumentation Readouts**
- **Microprocessor A/D Interface Subsystem**
- **Auto-Zeroed Microvolt or Strain-Gauge Systems**

BENEFITS

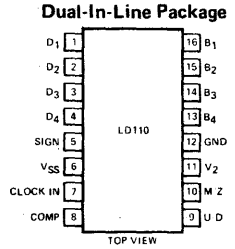
- Three Usable Ranges with a Single Resistor Change. 1.999 V, 199.9 nV, 19.99 mV
- Excellent System Performance From Basic 0.02% ±1 Count Accuracy
- Wide Sampling Rate: 1/3 to 40/Second
- High Gain Stability (5 ppm/°C) with Buffered Reference Input
- Reduced Signal Loading with MOSFET Input ($Z_{IN} > 10^9\ \Omega$)
- Auto-Zero System Minimizes Internal and External Offset and Drift Over Temperature
- Auto-Polarity with a Single Reference
- Easy Interface to Displays with Strobed BCD Output Format
- Overrange and Underrange Signals Available



DESCRIPTION

The "Quantized Feedback" conversion scheme used in the LD110/LD111A set provides an Auto-Zeroing, Auto-Polarity A/D system requiring only a single reference voltage.

The monolithic LD111A high performance analog processor contains a bipolar comparator, a bipolar integrating amplifier, a bipolar reference amplifier, two MOSFET input unity gain amplifiers, several P-channel enhancement mode analog switches and the necessary level shifting drivers to allow the analog and digital processors to be directly interfaced. The high impedance input and reference buffer amplifiers eliminate source loading errors and provide the outstanding temperature coefficient inherent in this system. Break-before-make switch action insures that neither the analog input nor the reference voltage will be shorted to ground at any time.



The PMOS LD110 synchronous digital processor combines the counting, storage and data multiplexing functions with the random logic necessary to control the quantized charge-balancing function of the analog processor. Seventeen static latches store the 3 1/2 digits of BCD data as well as overrange, underrange and polarity information. Nine push-pull output buffers (capable of driving one standard TTL load each) provide the sign, digit strobe and multiplexed BCD data outputs, all of which are active high. The digit scan is an interlaced format of digits 1, 3, 2 and 4.

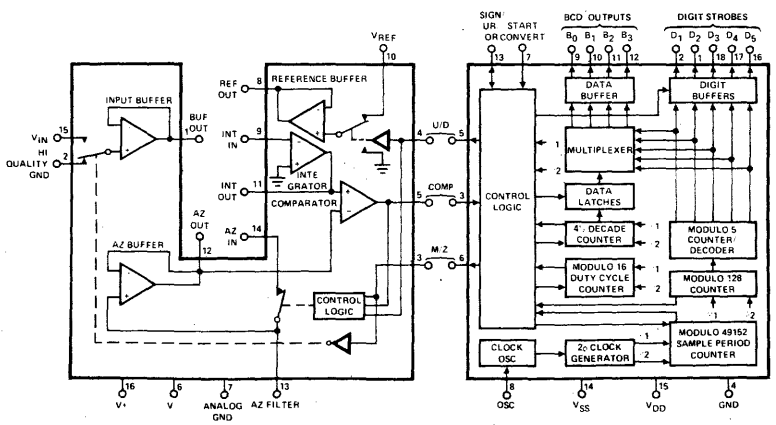
designed for . . .

- **High Accuracy Digital Voltmeters, Panel Meters**
- **Digital Scales, Thermometers**
- **Microprocessor Data Acquisition Systems**
- **Scientific Instrumentation**

BENEFITS

- **0.005% ±1 Count Accuracy Ensures High System Performance**
- **Two Ranges, ±2.0000 V or ±200.0 mV, With Single Resistor Change**
- **28,500 Count Maximum For 185% Overrange**
- **Sample Rate From One to Five/Second**
- **Auto-Zero Cycle Nulls Out Internal and External Amplifier Offsets**
- **Auto-Polarity Operation with One Reference**
- **Multiplexed BCD Output For Easy Interface To Displays**
- **Two Overrange Outputs, Underrange Output, Blink Inhibit, and Convert-On-Command Capabilities Allow Easy Interface to External Circuitry and Microprocessors**

DESCRIPTION



The LD120/LD121 4 1/2 digit A/D system uses Siliconix's proprietary "Quantized Feedback" (patent pending) conversion technique. Intrinsic features of this system are Auto-Polarity, Auto-Zero and ratiometric operation. No critical components are required except for a stable voltage reference. The technique offers superior linearity, normal mode rejection, and stability due to the simultaneous integration of the unknown input and the reference voltages. Unlike other conversion techniques, the integrator output voltage never represents more than 100 counts, thus critical, high resolution performance is not required of either the integrator or comparator.

The LD120 analog processor is fabricated with a unique combined PMOS/Bipolar process. It contains all the necessary amplifiers, MOSFET switches, and switch driver circuits for the system. The reference voltage input is fully buffered on the LD120 to eliminate the reference switch resistance as a source of error. All the amplifiers are internally compensated. The LD120 directly interfaces the LD121 digital processor with no additional active components required.

The LD121 synchronous processor contains all the digital circuitry for the quantized feedback system. Device outputs supply two overrange signals, underrange, sign and 4 1/2 digits of multiplexed BCD data. (All outputs are TTL compatible). Overrange is also indicated by blinking digit strobes above 20,000 counts. An input is provided to inhibit this feature at user option. Microprocessor controlled operation is simplified by a start conversion input that allows conversion-on-command.

Both devices are supplied in space saving 300 mil dual-in-line plastic packages. The LD120 has 16 pins and the LD121 has 18 pins.

BENEFITS

- Directly Interfaces to CMOS, TTL, DTL and MOS Logic Families
  - Low Drive Current ($I_{GSS} < 100$ nA)
  - Threshold Voltage 0.8 to 2.0 V
- Fan Out From CMOS > 100
- No Power Supply Required
- Permits Improved Data Transmission Rates
  - Propagation Delay Typically 4 nsec
- Reduces Component Count and Design Time/Effort
  - Drives Inductive Loads Directly
  - High Speed
- Improves Reliability
  - Free From Secondary Breakdown Failures and Voltage Derating
  - Input Protected From Static Discharge

ABSOLUTE MAXIMUM RATINGS

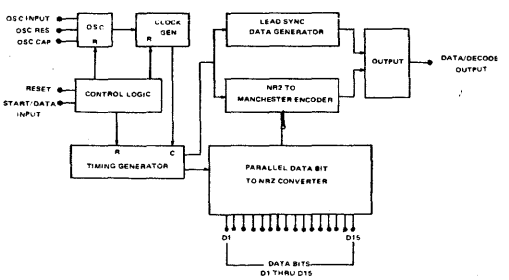
ED-15 / ED-11 / ED-9 ENCODER - DECODER

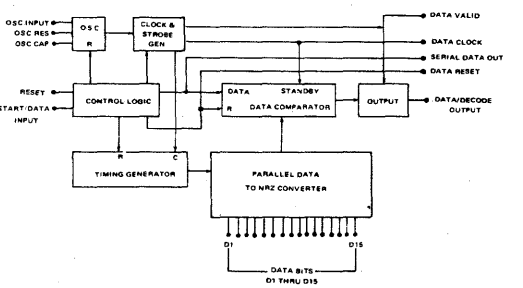
FEATURES

- Encoder/Decoder in one circuit
- Schmidt Trigger Input for excellent noise rejection
- Built-in oscillator
- Zener diode to regulate the power supply
- Low power, high noise immunity CMOS technology
- Ability to decode original signals



TYPICAL APPLICATIONS

- ☐ Smoke and Fire Alarm Control Systems
- ☐ Theft Alarm Systems
- ☐ Digital Locks
- ☐ Garage Door Openers
- ☐ Security Systems
- ☐ Digital Paging Systems
- ☐ Pocket Pagers
- ☐ Systems that require Special Identification Code
- ☐ Recognition or Transmission



GENERAL DESCRIPTION

ED-15 is a single monolithic chip using metal-gate CMOS technology for low cost, low power, high yield and high reliability. It is a dual purpose circuit, capable of working either as an encoder or as a decoder on special purpose coded identification applications where exclusive recognition of a special code is required. It will decode 1 of 32,768 codes. In the transmit mode each circuit is capable of generating all the possible codes by connecting the Data inputs to V_{DD} or GRD or "1" or "0". A 16 bit shift register (i.e. 4015's) can be attached to a ED-15 for monitoring a large number of encoders and interrogate each input. The encoder code will be loaded into the shift register.

BLOCK DIAGRAM AS A RECEIVER

ED-11 OPTION

The ED-11 is also a multi-purpose circuit identical to ED-15, but it decodes 1 of 2048 codes and transmits 4 bits of control data.

In the transmit mode each circuit is capable of generating all of the 2048 codes by connecting the Data inputs 1 thru 11 to V_{DD} for a "1". A "0" is automatically programmed by leaving the data line open because all the data lines have a pull-down resistor to GRD. Data bits 12 thru 15 can be used to transmit control information up to 16 codes by connecting them to V_{DD} or GRD. In adding external 4 bit shift registers (i.e. ½4015 or two 4013's) it can receive control information that will only be processed after the decoder recognizes the first 11 bits of data. Data bits 1 thru 11 are the only bits that are decoded, but Data Valid will not operate until the 15th bit.

ED-9 OPTION

ED-9 is also a multi-purpose circuit packaged in a 18 pin and has the capability of encoding and decoding 512 codes. Pins handling Serial Data Output, Data Reset, Data Clock Output and Data Valid are not on this device. So the monitoring capability is not available. Apart from these differences mentioned, the ED-9 operates exactly like the ED-15 and ED-11.

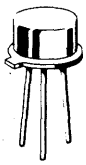
VF-01/VF-12/VF-13/VF-14 N-CHANNEL AND P-CHANNEL ENHANCEMENT-MODE MOSFET DRIVERS

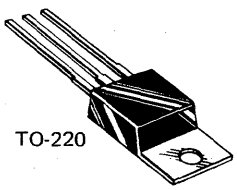
October 1978



APPLICATIONS

- ☐ High Speed Switching Drivers
- ☐ CMOS Logic to High Current/High Voltage Interface Driver
- ☐ Microprocessor to High Current/ High Voltage Interface Driver
- ☐ TTL to High Current Interface Driver
- ☐ High performance Linear Amplifiers
- ☐ Inductive Load Drivers
- ☐ DC to DC Converters
- ☐ Switching Power Supplies
- ☐ Low Power Complementary High Current/High Voltage Driver
- ☐ Display Driver

Packages



TO-3

TO-39

TO-92

TO-220

BENEFITS

- Directly Interfaces to CMOS, TTL, DTL, and MOS Logic Families.
- Low Drive Current Requirement ($I_{GSS} < 100$ nA).
- Permits more Efficient and Compact Switching Designs, Typical T_{ON} and T_{OFF} less than 5 nsec for 2 Amp device. Very short propagation delay and virtually no storage time delay.
- Reduces Component Count and Design Time/Effort, Drives Inductive Loads Directly, High Gain, Fan-Out from a CMOS Logic Gate exceeds 100 if speed is not critical. Easily Paralleled without Base Current Sharing Resistors to obtain very high Current Output.
- Improves Reliability, Free from Secondary Breakdown and Voltage Derating Output Current decreases as Temperature Increases.

VF-01/VF-12/VF-13/VF-14 N-CHANNEL AND P-CHANNEL ENHANCEMENT-MODE MOSFET DRIVERS

GENERAL DESCRIPTION

These four device families are normally-off MOSFET Drivers especially suited for Switching and Amplifier Applications where High Input Impedance, High Gain, High Frequency, and Fast Switching speed is desired. They combine the power handling capability of bipolar transistors with the high input impedence and negative temperature coefficient of field effect transistors. The key device parameters are, on-resistance, RDS (on), threshold voltage (V_T), and breakdown voltage (BVDSS). RDS (on) is related to die size, drain current, and V_T. BV_{DSS} depends on V_T and the silicon material used in the device manufacture.

Devices are available with and without Zener input protection.

ELECTRICAL CHARACTERISTICS

	Device Type	Current (Amps)	Voltage ** (Volts)	RDS(on)* (Ohms)	gm* (mhos)	Package Options				
						TO 3	TO39	TO92	TO220	Dice
N-Channel	VF-01	1-2	30-150	2-10	.25	X	X	X	X	X
	VF-12	8-16	30-200	.2-1	3.0	X	X		X	X

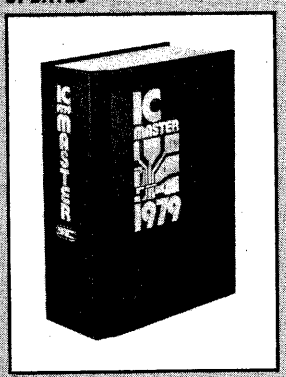
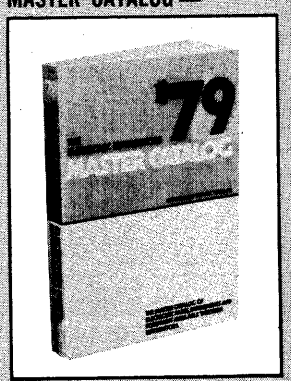
WE KNOW OUR STUFF



42 YEARS OF EXPERIENCE IN CATALOGING, 22 EDITIONS OF eem

eem/ELECTRONIC ENGINEERS MASTER CATALOG —



The "blue-ribbon" catalog/directory that has become "the standard of the industry" for electronic engineers, buyers and specifiers.

IC MASTER AND THE UPDATES —

The only complete single-source directory including all IC devices manufactured in the United States. Updated three times yearly with accumulative supplements.

ELECTRONIC DISTRIBUTORS MASTER CATALOG —

The only national catalog designed exclusively for distributors and their customers featuring electronic parts, instruments and equipment.

ELECTRONIC PRODUCTS MAGAZINE —

The products magazine . . . A 100% product-oriented magazine including hundreds of new products and special features every month.

eem FILE SYSTEM —

The only filing system designed especially for the electronics engineer. Instant retrieval and organization of data sheets and catalogs.

UTP CUSTOM CATALOGS —

The Cadillac of individualized catalogs for the electronic parts distributor, featuring solely his lines and services.

UNITED COST AND PRICING SERVICES —

The electronic distributors' proven method of being up to the minute on his cost and selling prices.

INTRODUCTION TO LINEAR

The Master Selection Guide provides sufficient information to make initial product selections. It enables you to find the products which are most appropriate to fulfill your major requirements and then provides data for many of the more important products.

All devices that appear in this section, both in the initial selection guide and in the data pages, are included in all other indexes. These index listings lead to the page and the line on that page where each device appears.

In the Linear section over 1000 operational amplifiers are covered. Since there are so many devices, the operational amplifier entries have been given special consideration. Separate lists are provided for those which have High Speed, High Voltage capability, Wide Bandwidth, etc. Under General Purpose, four amplifier types are listed; these are the ones that the high volume manufacturers indicate are the most widely used; however, quad amplifiers should also be considered when appropriate. If you have located an op amp in a specialized category, you can review its characteristics by finding it in the Part Number or Product Indexes and looking it up in the Operational Amplifier Characteristics and in the Data Sections.

Following the special lists, the "Operational Amplifier-Characteristics" listings, categorize amplifiers by input parameters. They are arranged in order of increasing offset voltage, bias current, offset current and then voltage drift. The other parameters listed do not affect the sequence in which the devices are presented. The column labeled "Comp" indicates the number of external components normally used for compensation; for example, "0" means no compensation is required.

Consumer circuits such as audio amplifiers, AM, FM, and TV circuits as well as some digital devices (watches, calculators, etc.) are covered by model number in the Consumer Circuit Section. Linear devices and unusual circuits which do not fit elsewhere are listed under the heading "Other Linear Devices."

LINEAR–Operational Amplifiers

General Purpose

The 101A series consists of the 101A (-55°C to 125°C), the 201A (-25°C to 85°C) and the 301 (0°C to 70°C). These units require an external compensation capacitor which permits the bandwidth to be optimized for particular applications.

Device	Source	Line
LM101A	AMD	
AD101A	AD	
µA101A	Fairchild	
101A	Intersil

LM101A	Signetics	
SG101A	Silicon G	
LM101A	TI	
TA7506	Toshiba	

The performance of the 741 series is similar to the 101. These units include internal compensation to make the device stable and to eliminate the need for an external capacitor.

Device	Source	Line

Dual Amplifiers. The 1458 (0°C to 70°C) and the 1558 (-55°C to 125°C) offer approximately the same performance as the 741. Compensation is built in.

FET Input. The "741" of the FET input devices has yet to be established. Such a device requires very low cost, several sources, and many users. Commercial devices in the 155 series above meet some of these criteria, however, devices from the series below are generally lower in cost.

LINEAR–Operational Amplifiers-Characteristics

Single Units

In this list the "Comp." column indicates the number of compensation components required at unity gain. Thus 0 indicates a fully compensated amplifier. The bandwidth and slew rate are listed with the amplifier compensated for unity gain.

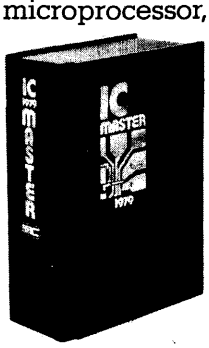
"I need to know if this device exists, and if there are any alternate sources. Where do I start?"

- Memory IC
- RAM
- Static
- 1024x1
- CMOS
- 250 Nanoseconds
- 5 Volts

If you're spending hours to solve a problem similar to the one above, you're behind the times...



It only takes a few seconds with "THE MASTER."

Clear your desk for action with the newly revised 1979 IC Master. Its all-under-one-cover features include: Over 40,000 standard products from more than 87 different companies . . . five different selection guides (memory, microprocessor, interface, linear and digital.) . . . alternate source directory for pin- for- pin, function- for- function replacements . . . applications directory . . . complete military section . . . a complete part numbering guide . . . etc.

You don't have to search through stacks of catalogs. Simply look up the specs and function you need. You don't need a part number to start with.

All you need is a problem to use The Master. Does the device exist? Who makes it? Is there an alternate source? What's the part number? Is there an applications note? Who is my closest distributor—etc.

(1) ±15V at ±10mA isolated power available to power external circuitry. (2) Isolation voltage tested at both ±5000Vp pulse test and 2500V, rms, 60Hz; leakage current tested for 2μA max, at 240V, rms, 60Hz. (3) 3650 is a current input device; to reduce input errors, very low input impedance is desirable. (4) At 240V/60Hz. (5) Models 700 or 710 isolated DC/DC converters may be used to provide isolated power. (6) Protected up to ±6000V.

ANALOG CIRCUIT FUNCTIONS

	Model	Comments	Package
SPECIAL FUNCTIONS			
Logarithmic Amplifier	4127	0.50 - 1% accuracy; 2 current input signals or 2 voltage input signals	DIP
Divider	4291	±0.25 to 1% untrimmed accuracy	DIP
Multifunction Converter (Multiply, divide, square root, etc.)	4301	Hermetically sealed metal package; compatible with 4302	DIP
	4302	$E_o = V_Y (V_Z/V_X)^m$; plastic package.	DIP
Peak Detector	4085	Read-out of DC voltage equal to peak value of complex wave form	DIP
RMS-to-DC Converter	4340	Laser-trimmed, no external trimming; metal package	DIP
	4341	Externally trimmed; low cost in plastic package	DIP
Oscillators	4023/25	Fixed-frequency (10Hz to 20kHz)	Module
	4423	Very-low cost, RC programmable, 0 to 20kHz	DIP
Comparators	4115/04	Provides window or dual limit for comparison	Module
	4082/03	Drives lamps, relays or logic loads	Module
Fixed-Frequency Active Filters	ATF76 Series	Pre-tuned, multiple pole bandpass, low-pass, and notch filters	DIP
Universal Active Filters	UAF41 UAF31 UAF21 UAF11	Variable type, 4-resistor, programmable, 2-pole filters; Q and f_c can be programmed; 3 outputs provide low-pass, high-pass and bandpass transfer functions; complex filter response by cascading.	DIP

XR-215 HIGH-FREQUENCY PHASE-LOCKED LOOP

The XR-215 is a highly versatile monolithic phase-locked loop (PPL) system designed for a wide variety of applications in both analog and digital communication systems. It is especially well suited for FM demodulation, frequency synthesis and tracking filter applications. The XR-215 operates over a power supply voltage ranging from 5V to 26V and has a wide frequency band of 0.5 Hz to 35 MHz. It can interface with conventional DTL, TTL, and ECL logic families.

FUNCTIONAL BLOCK DIAGRAM

FEATURES

Wide Frequency Range: 0.5 Hz to 35 MHz
Wide Supply Voltage Range: 5V to 26V
Digital Programming Capability
DTL, TTL, and ECL Logic Compatibility
Wide Dynamic Range: 300μV to 3V
ON-OFF Keying and Sweep Capability
Wide Tracking Range: Adjustable from ±1% to ±50%
High-Quality FM Detection: Distortion 0.15%
Signal/Noise 65 dB

APPLICATIONS

FM Demodulation
Frequency Synthesis
FSK Coding/Decoding (MODEM)
Tracking Filters
Signal Conditioning
FM, FSK, and Sweep Generation
Crystal Controlled Detection
Wideband Frequency Discrimination
Voltage-to-Frequency Conversion

XR-215	Ceramic	0°C to +75°C

XR-2211 FSK DEMODULATOR/ TONE DECODER

The XR-2211 is a monolithic phase-locked loop system especially designed for data communications and is particularly well-suited for FSK modem applications. It has a supply voltage range of 4.5V to 20V and a wide frequency range of 0.01 Hz to 300 kHz. The circuit accommodates analog signals between 2 mV and 3V and interfaces with conventional DTL, TTL, and ECL logic families. The XR-2211 consists of a basic PLL for tracking an input signal within the passband, a quadrature phase detector for carrier detection, and an FSK voltage comparator for FSK demodulation. Independent external components set center frequency, bandwidth, and output delay.

FUNCTIONAL BLOCK DIAGRAM

FEATURES

Wide Frequency Range	0.01 Hz to 300 kHz
Wide Supply Voltage Range	4.5V to 20V
DDT/TTL/ECL Logic Compatibility	
FSK Demodulation, with Carrier-Detection	
Wide Dynamic Range	2 mV to 3 Vrms
Adjustable Tracking Range (±1% to ±80%)	
Excellent Temperature Stability	20 ppm/°C, Typical

APPLICATIONS

FSK Demodulation
Data Synchronization
Tone Decoding
FM Detection
Carrier Detection

Phase-Locked Loops

XR-2212 PRECISION PHASE-LOCKED LOOP

The XR-2212 is an ultra-stable monolithic phase-locked loop (PLL) system especially designed for data communication and control system applications. It offers 20 ppm/°C temperature stability and is ideally suited for frequency synthesis, FM detection, and tracking filter applications.

The XR-2212 precision PLL is directly compatible with MOS, DTL, and TTL logic families and microprocessor peripheral systems. The circuit consists of a PLL system made up of an input preamplifier, a phase detector, a stable voltage-controlled oscillator (VCO), and a high-gain differential amplifier. The center frequency, bandwidth, and the tracking range of the PLL are controlled independently by the choice of external components.

FUNCTIONAL BLOCK DIAGRAM

FEATURES

Quadrature VCO Outputs	
Wide Frequency Range	0.01 Hz to 300 kHz
Wide Supply Voltage Range	4.5V to 20V
MOS/TTL/ECL Logic Compatibility	
Wide Dynamic Range	
Adjustable Tracking Range (±1% to ±80%)	
Excellent Temperature Stability	20 ppm/°C, Typical

APPLICATIONS

Frequency Synthesis	FSK Demodulation
Data Synchronization	Signal Conditioning
FM Detection	Clock Extraction
Tracking Filters

Timing Circuits

XR-L555 MICROPOWER TIMING CIRCUIT

The XR-L555 is a stable micropower controller capable of producing accurate timing pulses with low power dissipation. Typical power dissipation is 900 microwatts at 5V. The circuit offers both the monostable or the astable modes of operation and can operate with power supplies as low as 2.7 volts. It may be triggered or reset on falling waveforms. The output can source up to 50 mA or drive TTL circuits. The XR-L555 features temperature stability and low-voltage operation, ideal as a micropower clock oscillator or VCO for low-power CMOS systems. It can operate up to 1500 hours with only two 300 mA-Hr NiCd batteries.

FUNCTIONAL BLOCK DIAGRAM

FEATURES

Pin Compatible with Standard 555 Timer
Less than 1 mW Power Dissipation (V+ = 5V)
Timing from Microseconds to Minutes
Over 1000-Hour Operation with 2 NiCd Batteries
Low Voltage Operation (V+ = 2.7V)
Operates in Both Monostable and Astable Modes
CMOS, TTL, and DTL Compatible Outputs
Adjustable Duty Cycle
Temperature Stability of .005%/°C

APPLICATIONS

Battery Operated Timing	Micropower Oscillator
Micropower Clock Generator	Sequential Timing
Pulse Shaping and Detection	Pulse-Width Modulation
Micropower PLL Design	Pulse Position Modulation
Missing Pulse Detection	Appliance Timing
Power-On Reset Controller	Remote-Control Sequencer

Timing Circuits

XR-2242 LONG-RANGE TIMER

The XR-2242 is a monolithic Timer/Controller capable of producing ultra-long time delays from microseconds to days. Two timing circuits can be cascaded to generate time delays or timing intervals of up to one year. The circuit is comprised of an internal time-base oscillator, an 8-bit binary counter and a control flip-flop. For a given external RC network connected to the timing terminal, the circuit produces an output timing pulse of 128 RC. If two circuits are cascaded, a total time delay of $(128)^2$ or 16,384 RC is obtained.

In monostable timer applications, the output terminal (pin 3) is connected back to the reset terminal, the circuit continues to operate in an astable mode, subsequent to a trigger input.

FUNCTIONAL BLOCK DIAGRAM

FEATURES

Timing from Microseconds to Days
Wide Supply Range: 4.5V to 15V
TTL and DTL Compatible Outputs
High Accuracy: 0.5%
Excellent Supply Rejection: 0.2%/V
Monostable and Astable Operation

APPLICATIONS

Long Delay Generation
Sequential Timing
Precision Timing
Ultra-Low Frequency Oscillator
Interval Timing

Function Generators

XR-2206 MONOLITHIC FUNCTION GENERATOR

The XR-2206 is a monolithic function generator integrated circuit capable of producing high quality sine, square, triangle, ramp, and pulse waveforms of high stability and accuracy. The output waveforms can be both amplitude and frequency modulated by an external voltage. Frequency of operation can be selected externally over a range of 0.01 Hz to more than 1 MHz.

This circuit is ideally suited for communications, instrumentation, and function generator applications requiring sinusoidal tone, AM, FM, or FSK generation. It has a typical drift specification of 20 ppm/°C.

FUNCTIONAL BLOCK DIAGRAM

FEATURES

Low Sinewave Distortion (THD .5%)
Insensitive to Signal Sweep
Excellent Stability (20 ppm/°C, Typical)
Wide Sweep Range (2000:1, Typical)
Low Supply Sensitivity (0.01%/V, Typical)
Linear Amplitude Modulation
Adjustable Duty-Cycle (1% to 99%)
TTL Compatible FSK Controls
Wide Supply Range (10V to 26V)

APPLICATIONS

Waveform Generation
Sine, Square, Triangle, Ramp
Sweep Generation
AM/FM Generation
FSK and PSK Generation
Voltage-to-Frequency Conversion
Tone Generation
Phase-Locked Loops

XR-2207 VOLTAGE-CONTROLLED OSCILLATOR

The XR-2207 is a monolithic voltage-controlled oscillator (VCO) integrated circuit featuring excellent frequency stability and a wide tuning range. The circuit provides simultaneous triangle and squarewave outputs over a frequency range of 0.01 Hz to 1 MHz. It is ideally suited for FM, FSK, sweep or tone generation, and phase-locked loop applications.

The XR-2207 has a typical drift specification of 20 ppm/°C. The oscillator frequency can be linearly swept over a 1000:1 range with an external control voltage.

FUNCTIONAL BLOCK DIAGRAM

FEATURES

Excellent Temperature Stability (20 ppm/°C)
Linear Frequency Sweep
Adjustable Duty Cycle (0.1% to 99.9%)
Two or Four Level FSK Capability
Wide Sweep Range (1000:1 Minimum)
Logic Compatible Input and Output Levels
Wide Supply Voltage Range (±4V to ±13V)
Low Power Sensitivity (0.15%/V)
Wide Frequency Range (0.01 Hz to 1 MHz)
Simultaneous Triangle and Squarewave Outputs

APPLICATIONS

FSK Generation
Voltage and Current-to-Frequency Conversion
Stable Phase-Locked Loop
Waveform Generation
  Triangle, Sawtooth, Pulse, Squarewave
FM and Sweep Generation

ORDER INFORMATION

XR-2209 PRECISION OSCILLATOR

The XR-2209 is a monolithic variable frequency oscillator circuit featuring excellent temperature stability and a wide linear sweep range. The circuit provides simultaneous triangle and squarewave outputs over a frequency range of 0.01 Hz to 1 MHz. The frequency is set by an external RC product. It is ideally suited for frequency modulation, voltage-to-frequency or current-to-frequency conversion, sweep or tone generation, as well as for phase-locked loop applications when used in conjunction with a phase comparator such as the XR-2208.

The circuit is comprised of three functional blocks: a variable frequency oscillator, and two buffer amplifiers. The XR-2209 has a typical drift specification of 20 ppm/°C. Its frequency can be linearly swept over a 1000:1 range with an external control signal.

FUNCTIONAL BLOCK DIAGRAM

FEATURES

Excellent Temperature Stability (20 ppm/°C)
Linear Frequency Sweep
Wide Sweep Range (1000:1 Minimum)
Wide Supply Voltage Range (± 4V to ± 13V)
Low Supply Sensitivity (0.15%/V)
Wide Frequency Range (0.01 Hz to 1 MHz)
Simultaneous Triangle and Squarewave Outputs

APPLICATIONS

Voltage and Current-to-Frequency Conversion
Stable Phase-Locked Loop Oscillator
Waveform Generation
FM and Sweep Generation

XR-072 DUAL LOW-NOISE BIFET OPERATIONAL AMPLIFIER

The XR-072 family of junction-FET input dual op-amps are the low-noise version of Exar's XR-082 dual BIFET op-amp circuits. The combination of low noise, high slew-rate and the low output distortion characteristics of these op-amps make them ideal for high gain audio preamplification or analog signal processing systems.

FUNCTIONAL BLOCK DIAGRAM

FEATURES

Direct Replacement for Texas Instruments TL072
Low Noise (V_n = 18 nV/$\sqrt{Hz}$ Typ.)
Low Harmonic Distortion (0.01% Typ.)
Same Pin Configuration as XR-1458/XR-4558
Low Power Consumption
Low Input Bias and Offset Currents
Output Short-Circuit Protection
High Input Impedance . . . FET-Input Stage
Internal Frequency Compensation
Latch-Up-Free Operation
High Slew-Rate . . . 13 V/μs, Typ.

APPLICATIONS

High-Quality Audio Preamplification
Low-Level Signal Detection
Active Filter Design
Signal Conditioning
Analog Amplification
Audio Signal Processing

XR-074 QUAD LOW-NOISE BIFET OPERATIONAL AMPLIFIER

The XR-074 junction FET-input quad operational amplifier is the low-noise version of Exar's XR-084 quad BIFET op-amp circuit. The low noise and low harmonic distortion characteristics make the XR-074 family of quad op-amps ideally suited for high-fidelity and audio preamplifier applications. Each of the four low-noise op-amps on the chip is fabricated using ion-implantation technology which combines well-matched junction FETs and high-performance bipolar transistors on the same monolithic integrated circuit.

FUNCTIONAL BLOCK DIAGRAM

FEATURES

Direct Replacement for Texas Instruments TL074
Low Noise (V_n = 18 nV/$\sqrt{Hz}$ Typ.)
Same Pin Configuration as XR-3403
High-Impedance Junction FET-Input Stage

XR-082/XR-083 DUAL BIFET OPERATIONAL AMPLIFIERS

The XR-082/XR-083 family of junction-FET input (BIFET) dual operational amplifiers are designed to offer high performance and a wider selection than conventional bipolar op-amps. Each amplifier features high slew rate, low input bias and offset currents, and low offset voltage drift with temperature.

FUNCTIONAL BLOCK DIAGRAMS

Note: Pins 9 and 13 are internally connected.

FEATURES

Direct Replacement for Texas Instrument TL082 and TL083
Low Power Consumption
Wide Common-Mode and Differential Voltage Ranges
Low Input Bias and Offset Currents
Output Short-Circuit Protection
High Input Impedance: FET Input Stage
Internal Frequency Compensation
Latch-Up Free Operation
High Slew Rate: 13V/μs, Typical

XR-094 QUAD PROGRAMMABLE BIFET OPERATIONAL AMPLIFIER

The XR-094 is a programmable version of the XR-084 family of quad FET-input operational amplifiers. The circuit offers partitioned programming where the three of the four op-amps on the chip are programmed by one external bias-setting resistor, and the fourth op-amp is programmed by a second bias-setting resistor. These two external setting resistors permit the user to program the gain-bandwidth product, slew-rate and the supply current, especially for low power applications. The XR-094 programmable BIFET quad op-amp is fabricated using ion-implantation technology which combines well-matched junction FETs and high-performance bipolar transistors on the same monolithic integrated circuit.

FUNCTIONAL BLOCK DIAGRAM

FEATURES

Programmable Version of Texas Instruments TL084
Same Pin Configuration as LM146/246/346
Programmable for Micropower Operation
Partitioned Programming (Single/Triple Combination)
High-Impedance Junction-FET Input Stage
Internal Frequency Compensation
Low Input Bias and Offset Currents

Operational Amplifiers

XR-146/246/346 PROGRAMMABLE QUAD OPERATIONAL AMPLIFIER

The XR-146 family of quad operational amplifiers contain four independent high-gain, low-power, programmable op-amps on a monolithic chip. The use of external bias setting resistors permit the user to program gain-bandwidth product, supply current, input bias current, input offset current, input noise and the slew rate.

The basic XR-146 family of circuits offer partitioned programming of the internal op-amps where one setting resistor is used to set the bias levels in the three op-amps, and a second bias setting is used for the remaining op-amp. Its modified version, the XR-346-2 provides a separate bias setting resistor for each of the two op-amp pairs.

FUNCTIONAL BLOCK DIAGRAMS

FEATURES

Direct Replacement for LM146/246/346 (XR-146 Family)
Direct Replacement for LM346-2 (XR-346-2)
Programmable Electrical Characteristics
Low Supply Current (350 μA per Amplifier)
Large DC Voltage Gain (120 dB)
Low Noise Voltage (25 nV/$\sqrt{\text{Hz}}$)
Wide Power Supply Range (±1.5V to ±22V)
Class AB Output Stage—No Crossover Distortion

XR-5532/5533/5534 LOW-NOISE OPERATIONAL AMPLIFIER

The XR-5532/5533/5534 ultra-low noise operational amplifiers are especially designed for high quality audio and instrumentation applications. The XR-5532 and the XR-5534 both come in 8-pin packages. The XR-5532 is a dual op amp, and the XR-5533 is a 14-pin version of the XR-5532. Compared to the standard 741- or 301-type op amps, these operational amplifiers show an order of magnitude better noise performance and small-signal bandwidth, and higher output drive capability. They are all internally compensated, and the dual versions offer independent offset adjustments for each of the two op amps.

FUNCTIONAL BLOCK DIAGRAMS

FEATURES

Direct Replacement for NE5532
Ultra-Low Input Noise (4 nV/$\sqrt{\text{Hz}}$ Typ.)
Wide Small-Signal Bandwidth (10 MHz Typ.)
High Output Drive Capability (10 V rms into 600Ω)
Wide Supply Range (± 3V to ± 20V)
Wide Power Bandwidth (200 kHz)
High Slew-Rate: 6V/μsec Dual Version 13 V/μsec
Independent Offset Adjustments (Dual Versions)

APPLICATIONS

Professional Audio Equipment
Instrumentation and Servo Control
Telephone Channel Amplifier
Low-Level Signal Processing
Audio Preamplification

Voltage Regulators

XR-1524/2524/3524 PULSE WIDTH MODULATING REGULATOR

This monolithic integrated circuit contains all the control circuitry for a regulating power supply inverter or switching regulator. Included in a 16-pin dual-in-line package is the voltage reference, error-amplifiers, oscillator, pulse-width modulator, pulse-steering flip-flop, dual alternating output switches and current-limiting and shut-down circuitry. This device can be used for switching regulators of either polarity, transformer coupled DC to DC converters, transformerless voltage doublers and polarity converters, as well as other power control applications. The XR-1524 is specified for operation over the full military temperature range of -55°C to +125°C, while the XR-2524 and XR-3524 are designed for commercial applications of 0°C to +70°C.

FUNCTIONAL BLOCK DIAGRAM

FEATURES

Direct Replacement for SG1524/2524/3524
Complete PWM Power Control Circuitry
Single-Ended or Push-Pull Outputs
Lines and Load Regulation of 0.2%
1% Maximum Temperature Variation
Total Supply Current Less than 10 mA
Operation Beyond 100 kHz

High Current Drivers

XR-2201/2202/2203/2204 HIGH-VOLTAGE, HIGH-CURRENT DARLINGTON TRANSISTOR ARRAYS

The XR-2201/2202/2203/2204 Darlington transistor arrays are comprised of seven silicon NPN Darlington pairs on a single monolithic substrate. All feature open-collector outputs and internal protecton diodes for driving inductive loads. Peak inrush currents of up to 600 mA are allowable, making them also ideal for driving tungsten filament lamps. Although the maximum continuous collector current rating is 500 mA for each driver, the outputs may be paralleled to achieve higher load current capability.

FUNCTIONAL BLOCK DIAGRAM

FEATURES

High Peak Current Capability: 600 mA
Internal Protection Diodes for Driving Inductive Loads
Directly Compatible with TTL, CMOS, PMOS, and DTL Logic Families
Exact Replacement for Sprague Types ULN2001A, ULN2002A, ULN2003A, and ULN2004A

APPLICATIONS

Solenoid and Relay Driver
High Current LED Driver
Printing Calculator Hammer Driver
High Current Switch
Tungsten Lamp Driver

Display Drivers

XR-6118 FLUORESCENT DISPLAY DRIVER

The XR-6118 is a high-voltage monolithic IC consisting of eight NPN Darlington Output stages, along with their common-emitter type input stages. The circuit is designed to interface between low-level digital logic and high-voltage vacuum fluorescent displays. The XR-6118 is capable of driving the digits and/or segments of these displays and are designed to permit all eight outputs to be activated simultaneously. Pulldown resistors are incorporated into each output and no external components are required for most fluorescent display applications. It is directly compatible with standard or Schottky TTL, DTL, and 5-volt CMOS logic families.

FUNCTIONAL BLOCK DIAGRAM

FEATURES

Direct Replacement for Sprague UDN-6118A
Digit or Segment Drivers
Low Input Current
Integral Output Pulldown Resistors
Low Power
Reliable Monolithic Construction
High Output Breakdown Voltage

APPLICATIONS

Fluorescent Driver
Gas-Discharge Display Driver
High-Voltage Switching

Semi-custom Bipolar Program

The Exar bipolar semi-custom design program offers a variety of "semi-custom" chips to fulfill various application performance requirements and complexities.

These semi-custom chips offer a unique method of manufacturing an almost unlimited variety of custom linear and digital integrated circuits with greatly reduced cost and development time. Exar makes this possible by stocking wafers that are completely fabricated except for the final process step of device interconnection which metalizes the selected components together in the required circuit configurations.

BIPOLAR SEMI-CUSTOM CHIPS

Chip Type	Chip Size in Mils	Breakdown Voltage	NPN	PNP
A100	73 X 83	22V	60	18
B100	85 X 85	22V	69	12
C100	87 X 78	28V	48	10
D100	80 X 80	36V	50	16*
+F100	91 X 110	22V	97	32*

+Presently under development

*Dual collector PNP transistors

Exar offers a design kit which contains simple instructions and guidelines for designing the metal mask as well as actual breadboard components (consisting of NPN and PNP arrays and integrated resistors), which are representative of the devices available on the semi-custom chips. This provides the design engineer with the ability to closely evaluate his design performance prior to integrating it on a monolithic chip.

Semi-custom I^2L Program

With the introduction of the I^2L Gate-Array chips, Exar has extended its semi-custom design program to the Integrated Injection Logic (I^2L) technology. This unique method of custom LSI development technique now makes it possible to manufacture an almost unlimited variety of digital or analog/digital circuits using I^2L technology, at a greatly reduced development cost and time.

I^2L SEMI-CUSTOM CHIPS

Characteristics	Chip Type		
	XR-300	XR-400	XR-500
Chip Size (mils)	104 X 140	111 X 111	122 X 185
I^2L Gates	288	272	520
Max. Operating Voltage			
A-Option	6V	6V	6V
B-Option	15V	15V	15V
Bipolar I/O Interfaces	28	38	40
Bonding Pads	34	38	42

The XR-300 and the XR-500 gate-arrays are intended primarily for digital LSI designs. The XR-400 gate-array features the advantages of combining analog and digital functions on the same IC chip. These I^2L gate-array chips are customized using two or more custom mask patterns which are simultaneously generated from a pencil layout, using Exar's unique computerized mask generation technique. In this manner, the chip layout is greatly simplified and gate-utilization efficiency is increased.

Exar also offers an I^2L design kit which is intended to familiarize the designer with the basic features of I^2L technology and provide helpful design guidelines in reducing his design from concept to breadboard and finally to the IC layout stage.

Full Custom Development

Exar offers a complete design and production capability for full-custom IC development using Exar's bipolar and I^2L technologies. This provides an excellent complement to Exar's unique semi-custom capability.

Exar's full-custom IC development and production capabilities offer complete flexibility to meet changing customer needs or design problems. We can develop a complete custom IC starting from your "black-box" specifications or reduce your working breadboard prototype to a monolithic chip. Alternately, if you have the facilities and resources to do the IC design and the layout, Exar will provide you with the device characteristics and IC layout rules for the particular process suitable to your design and review your IC layout for you. Then, Exar can generate the IC tooling and fabricate your IC prototypes for you.

Exar's bipolar process technology is compatible with the manufacturing processes available from many of the other IC manufacturers. Thus, if you have developed a set of IC tooling with another manufacturer and would like an alternate or substitute supplier for your custom IC product, in most cases your existing IC tooling may be directly compatible with Exar's technology.

Exar's Engineering Department has two custom IC design groups dedicated to the development of linear and digital custom LSI. We pride ourselves in our flexibility and quick response to your needs.

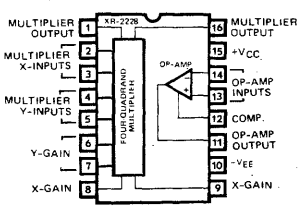
Special Functions

XR-13600 DUAL OPERATIONAL TRANSCONDUCTANCE AMPLIFIER

The XR-13600 consists of 2 programmable transconductance amplifiers with high input impedance and push-pull outputs. The 2 amplifiers share common supplies but otherwise operate independently. Each amplifier's transconductance is directly proportional to its applied bias current. To improve signal-to-noise performance, predistortion diodes are included on the inputs. Independent Darlington emitter followers are included to buffer the outputs. Other XR-13600 features: direct replacement for LM-13600, transconductance adjustable over 4 decades, excellent transconductance-control linearity. Other applications: current-controlled amplifiers, impedances, filters, and oscillators; multipliers/attenuators; sample-and-hold circuits; and electronic music synthesis. Available in commercial grade plastic package.

FUNCTIONAL BLOCK DIAGRAM



ORDER INFORMATION

Part Number	Package	Operating Temperature
XR-13600CP	Plastic	0°C to +75°C

XR-2228 MULTIPLIER/ DETECTOR

The XR-2228 multiplier/detector circuit is designed as a basic building block for analog signal processing and communication systems. Because of its wide common-mode range and differential inputs, the XR-2228 can interface with any of the existing PLL circuits in designing synchronous AM detection or frequency translation systems. It can be used as a phase-detector for frequencies up to 100 MHz. Other applications: AM generation, triangle-to-sinewave conversion, and frequency translation. Available in military and commercial grade ceramic packages or commercial plastic.

FUNCTIONAL BLOCK DIAGRAM

ORDER INFORMATION

Part Number	Package	Operating Temperature
XR-2228M	Ceramic	−55°C to +125°C
XR-2228CN	Ceramic	−40°C to +85°C
XR-2228CP	Plastic	0°C to +75°C

Application Notes & Technical Literature

Exar's technical staff and applications engineers have prepared a number of application notes and comprehensive Data Books which cover most of the key features and applications of Exar's IC products.

APPLICATION NOTES

AN-01: Stable FSK Modems Featuring the XR-2206, XR-2207 and XR-2211
AN-02: XR-C240 Monolithic PCM Repeater
AN-03: Active Filter Design With IC Op Amps
AN-04: XR-C277 Low-Voltage PCM Repeater IC
AN-05: Tri-State FSK Modem Design Using XR-2206/ XR-2211
AN-06: Precision PLL System Using XR-2207/ XR-2208
AN-07: Single-Chip Frequency Synthesizer Employing the XR-2240
AN-08: Dual-Tone Decoding with XR-567 and XR-2567
AN-09: Sinusoidal Output From XR-215 Monolithic PLL Circuit
AN-10: XR-C262 High-Performance PCM Repeater
AN-11: A Universal Sinewave Converter Using the the XR-2208 and XR-2211
AN-12: A Wide Tracking Range Precision PLL System Using the XR-2212 and XR-4151
AN-13: Frequency Selective AM Detection Using Monolithic Phase-Locked Loops
AN-14: A Complete Function Generator System Using the XR-2206
AN-15: An Electronic Music Synthesizer Using the XR-2207 and the XR-2240
AN-16: Semi-Custom LSI Design with I^2L Gate Arrays
AN-17: XR-C409 Monolithic I^2L Test Circuit

TECHNICAL LITERATURE

Timer Data Book. Provides a collection of technical articles and application information on monolithic timer IC products.

Phase-Locked Loop Data Book. Covers the fundamentals of design and applications of monolithic phase-locked loop (PLL) circuits.

Function Generator Data Book. Contains a number of technical articles and application notes on monolithic voltage-controlled oscillator (VCO) and function generator IC products.

Operational Amplifier Data Book. Contains a collection of technical articles on the fundamentals of monolithic IC op amps.

Applications Data Book. Contains a complete and up-to-date set of application notes prepared by Exar's technical staff on FSK modems, active filters, telecommunication circuits, electronic music synthesis and many more.

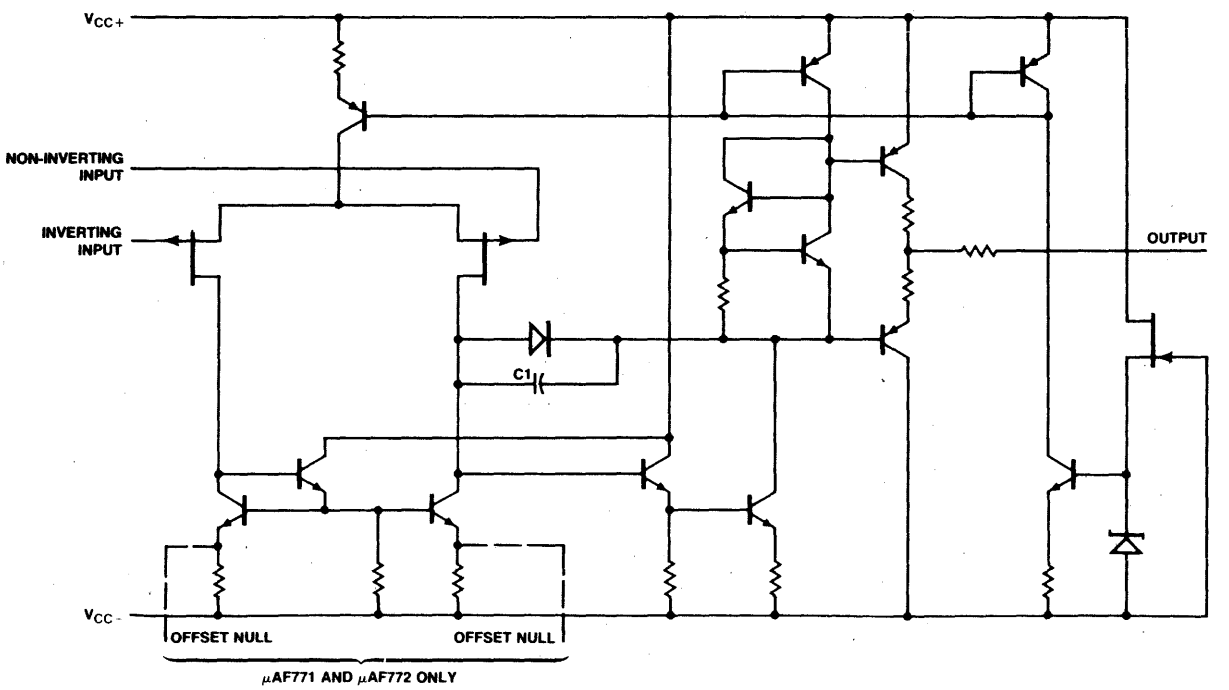
μAF771 SINGLE • μAF772 DUAL • μAF774 QUAD BIFET

FET INPUT OPERATIONAL AMPLIFIER FAMILY

FAIRCHILD LINEAR INTEGRATED CIRCUITS



GENERAL DESCRIPTION – These monolithic BIFET input operational amplifiers incorporate well matched ion implanted BIFETS on the same chip with standard bipolar transistors. The key features of these op amps are low input bias currents in the sub nanoamp range plus high slew rate (13 V/μs typically) and wide bandwidth (3.0 MHz typically).

- **LOW INPUT BIAS CURRENT – 200 pA FOR μAF774C**
- **LOW INPUT OFFSET CURRENT – 100 pA FOR μAF774C**
- **HIGH SLEW RATE – 13 V/μs TYPICALLY**
- **WIDE BANDWIDTH – 3.0 MHz TYPICALLY**

GBW	Gain Bandwidth Product	V_S = ±15 V, T_A = 25°C		3.0			3.0			3.0			3.0		MHz
e_n	Equivalent Input Noise Voltage	T_A = 25°C R_S = 100 Ω, f = 1000 Hz		16			16			16			16		nV/√Hz
i_n	Equivalent Input Noise Current	T_j = 25°C, f = 1000 Hz		0.01			0.01			0.01			0.01		pA/√Hz

NOTES:

1. Rating applies to ambient temperatures up to 70°C above T_A = 70°C. Derate linearly 6.3 mW/°C for the metal can, 5.6 mW/°C for the mini DIP and 8.3 mW/°C for the DIP.
2. Unless otherwise specified the absolute maximum negative input voltage is equal to the negative power supply voltage.
3. These specifications apply for V_S = ±15 V and 0°C ≤ T_A ≤ +70°C. V_{OS}, I_B and I_{OS} are measured at V_{CM} = 0.
4. The input bias currents are junction leakage currents which approximately double for every 10°C inrease in the junction temperature, T_j. Due to limited production test time, the input bias currents measured are correlated to junction temperature. In normal operation the junction temperature rises above the ambient temperature as a result of internal power dissipation, P_D. $T_j = T_A = \Theta_{jA} P_D$ where Θ_{jA} is the thermal resistance from junction to ambient. Use of a heat sink is recommended if input bias current is to be kept to a minimum.
5. Supply voltage rejection ratio is measured for both supply magnitudes increasing or decreasing simultaneously in accordance with common practice.

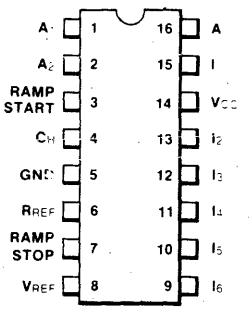
μA9708



6-CHANNEL, 8-BIT, MICROPROCESSOR COMPATIBLE
ANALOG-TO-DIGITAL CONVERTER SUBSYSTEM*

GENERAL DESCRIPTION — The μA9708 is a single slope 8-bit, 6-channel ADC subsystem that provides all of the necessary analog functions for a microprocessor-based data control system. The device uses a microprocessor system like the F3870 or F6800 to provide the necessary addressing, timing and counting functions and includes a 1 of 8 decoder, 8-channel analog multiplexer, sample and hold, ramp integrator, precision ramp reference, and a comparator on a single monolithic chip.

- **MPU COMPATIBLE**
- **EXCELLENT LINEARITY OVER FULL TEMP RANGE - ±0.2% MAX**
- **TYPICAL 300 μs CONVERSION TIME PER CHANNEL**
- **WIDE DYNAMIC RANGE INCLUDES GROUND**
- **AUTO-ZERO AND FULL-SCALE CORRECTION CAPABILITY**
- **RATIOMETRIC CONVERSION — NO PRECISION REFERENCE REQUIRED**
- **SINGLE-SUPPLY OPERATION**
- **TTL COMPATIBLE**

Input Capacitance	C_{IN}			3.0		pF
Comparator Output Capacitance	C_{OUT}			5.0		pF

NOTES:
1. Conversion accuracy is defined as the deviations from a straight line drawn between the points defined by channel address 000 (0 scale) and channel address 111 (full scale) for all channels.
2. Linearity is defined as the deviation from a straight line drawn between the 0 and full scale points for each channel.
3. Power supply rejection ratio is defined as the conversion error contributed by power supply voltage variations while resolving mid scale on any channel.
4. Crosstalk between channels = 20 log $\frac{\Delta V_{CH}}{\Delta V_i}$

FUNCTIONAL DESCRIPTION

This Analog to Digital Converter is a single-slope 8-bit, 6-channel A/D converter that provides all of the necessary analog functions for a microprocessor-based data/control system. The device uses the processor system to provide the necessary addressing, timing and counting functions and includes a 1 of 8 decoder, 8-channel analog multiplexer, sample and hold, precision current reference, ramp integrator and comparator on a single monolithic chip.

For applications that require auto-zero or auto-calibration, *(See Figures 2-5)* line select address 0, 0, 0 and 1, 1, 1 may be used in conjunction with the arithmetic capability of the microprocessor to provide ground and scaling factors. Address 0, 0, 0 internally connects the input of the ramp generator to ground and may be used for zero offset correction in subsequent conversions. Address 1, 1, 1 internally connects the input of the ramp generator, to the voltage reference, V_{REF}, and may be used for scale factor correction in subsequent conversions. For the following, refer to the Functional Block Diagram.

Six separate external analog voltage inputs may come into terminals I_1-I_6 and the specific analog input to be converted is selected via address terminals A_0-A_2. The analog input voltage level is transferred to the external ramp capacitor connected to pin 4 when the input to the ramp start terminal (pin 3) is at a logic 0 *(See Figure 1)*. The time to charge the capacitor is the acquisition time

©IC MASTER 1979

which is a function of the output impedance of an amplifier internal to the A/D and the value of the capacitor. After charging the external capacitor the ramp start terminal is switched to a logic 1 which introduces a high impedance between the analog input voltage and the external capacitor.

The capacitor begins to discharge at a controlled rate. The controlled rate of discharge (ramp) is established by the external reference voltage, the external reference resistor, the value of the external capacitor and the internal leakage of the A/D. Connected to the capacitor terminal is a comparator internal to the A/D with its output going to the ramp stop terminal (pin 7). The comparator output is a logical one when the capacitor is charged and switches to a logic 0 when the capacitor is in a discharged state. The ramp time is the time from when ramp start goes high (logic "1") to when ramp stop goes low (logic "0"). The microprocessor must be programmed to determine this conversion time. The ideal (no undesirable internal source impedances, leakage paths, errors on levels where comparator switches or delay time) conversion time is calculated as follows.

$$\text{Ramp Time} = V_1 \frac{C_H}{I_R}$$

Where V_1 = Analog Input Voltage being measured

C_H = External Ramp Capacitor

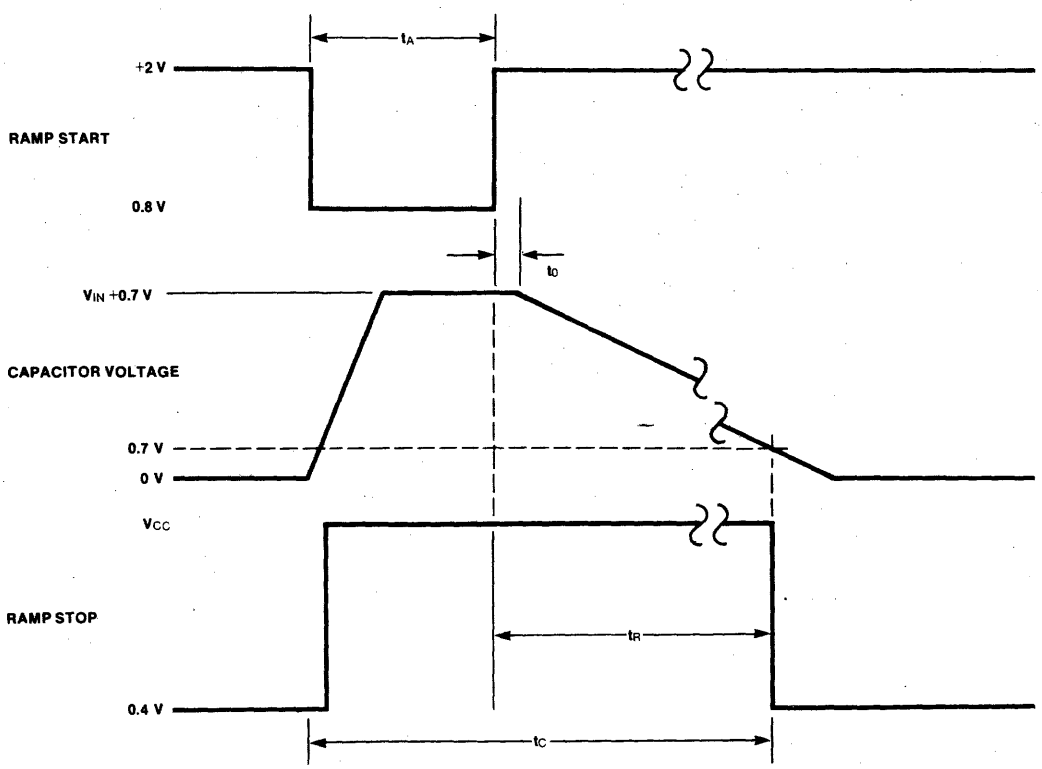
$$I_R = \frac{V_{CC} - V_{REF}}{R_{REF}}$$

Where V_{CC} = Power Supply Voltage

V_{REF} = Reference Voltage

R_{REF} = Reference Resistor

In actual use the errors due to a nonideal A/D can be minimized by using a microprocessor to make the calculations. *(See Figures 2 through 5)*



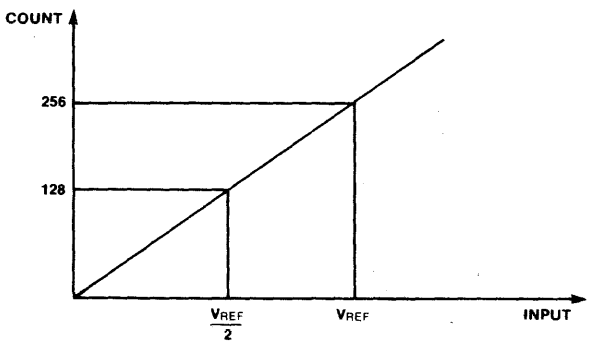


Fig. 1 Equivalent Timing Waveform for Test Circuits and Applications

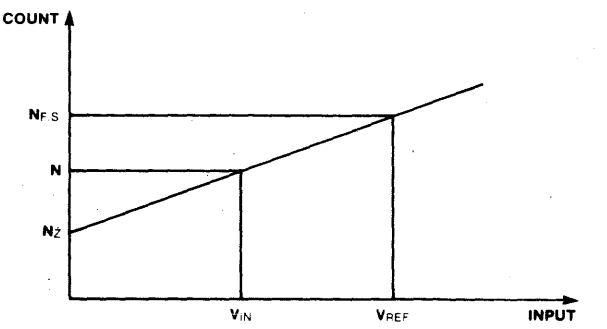
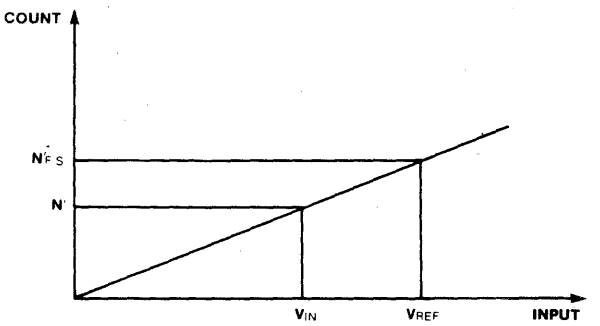
©IC MASTER 1979

APPLICATION HINTS AND FORMULAS



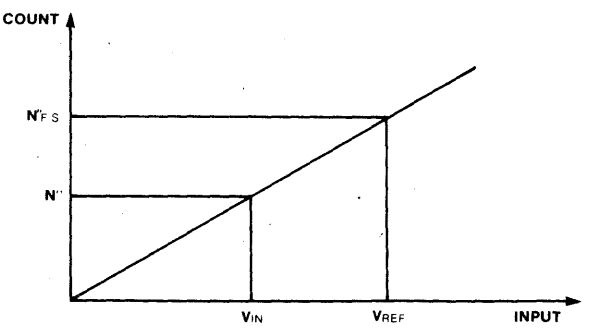
1. The capacitor node impedance is approximately 30 μΩ and should have no parallel resistance for proper operation.
2. t_R when V_{IN} = 0 V will be finite (i.e., the comparator will always toggle for $V_{IN} \geq 0$ V.)
3. The ramp stop output is open collector, and an external pull up resistor is required.
4. All digital inputs and outputs are TTL compatible.
5. For proper operation timing commences on the 0 to 1 transition of ramp start and terminates on the 1 to 0 transition of ramp stop.
6. $t_A \geq \frac{C_H}{150\ \mu A - I_R} \times V_{REF}$
7. t_R (ramp time) $= \frac{C_H}{I_R} \times V_{IN}$, $t_R\big|_{max} = \frac{C_H}{I_R} \times V_{REF}$
8. $I_R = \frac{V_{CC} - V_{REF}}{R_{REF}}$
9. $2\ V \leq V_{REF} \leq (V_{CC} - 2\ V)$
10. Address lines A_0, A_1, A_2 must be stable throughout the sampling interval, t_A.
11. Pin 6 (R_{REF}) should be bypassed to ground via a 0.02 μF capacitor.

AUTO-ZERO AND FULL-SCALE FEATURES



- NO ZERO OFFSET
- NO FULL-SCALE ERROR
- COUNT (N) = $\frac{V_{IN}}{V_{REF}}$ = 256

Fig. 2 Ideal Transfer Function



- $N_{FS} \neq 256$
- $N_Z \neq 0$
- (N) HAS BOTH FULL-SCALE AND ZERO ERRORS.

Fig. 3 Transfer Function with Zero and Full-Scale Error

- $N' = N - N_Z$
- N' HAS FULL-SCALE ERROR

Fig. 4 Zero-Correction Added

TEST CIRCUITS

INPUT TIMING:

$t_A > 400\ \mu s$

$$V_{REF} = \left(\frac{3.3\ k\Omega}{2\ k\Omega + 3.3\ k\Omega}\right) 5\ V = 3.1\ V$$

$$I_R = \frac{5 - 3.1}{100\ k\Omega} = 19\ \mu A$$

$$t_R\Big|_{max} = \text{full scale ramp time} = \frac{0.01 \times 10^{-6}}{19 \times 10^{-6}} \times 3.1 = 1.6\ ms$$

NOTE:
For evaluation purposes, the ramp start timing generation can be implemented with a μA555 timer (astable operation) or MPU evaluation kit, and a time internal meter for ramp time measurement. The TIM meter will measure the time between the 0 to 1 transition of the ramp start and the 1 to 0 transition of the ramp stop. The ramp stop is open collector, and must have an external pull up resistor to V_{CC}.

TYPICAL APPLICATIONS

ΔV_I = (Applied Force) and can be Linearized (if necessary) in F8 Software.

Ratiometric Strain Gage Sensor/Controller

APPLICATIONS:

- **BEVERAGE BREWERS/DISPENSERS**
- **CHEMICAL SOLUTION CONTROL**
- **AUTOMATIC LIQUID MIXING CONTROL**

$$\text{RAMP CURRENT} = I_R = V_{CC}\left(\frac{R_1}{R_1 + R_2}\right)\left(\frac{1}{R_3}\right)$$

$$V_I = \left(\frac{R_X}{R_X + R_B}\right) V_{CC+}$$

$$\text{RAMP TIME} = V_I \frac{C_H}{I_R} = \left(\frac{R_X}{R_X + R_B}\right)\left(1 + \frac{R_2}{R_1}\right)\left(C_H R_3\right)$$

Opaque Solution Controller

©IC MASTER 1979

SYSTEM HINTS:

Several alternatives exist from a hardware/software standpoint in microprocessor based systems using the μA9708.

1. The ramp time measurement may be implemented in software using a register increment, followed by a branch back depending on the status of the ramp stop.

2. Alternately, the ramp stop may be tied into the interrupt structure in systems containing a programmable binary timer. This scheme has the following advantages:

   A. The CPU is not committed during the ramp time interval.
   B. It requires only 4 bits of an I/O port for control signals.

3. The auto-zero/auto-full-scale (see *Figures 2-5*) should use double precision, rounded (as opposed to truncated) arithmatics. Several points are worth noting:

   A. The subtractions are single op code instructions.
   B. The full scale correction uses a multiply by 256 and can be accomplished by a shift left 8 bits (usually one instruction) or placing (N-Nz) in the MSB register and setting the LSB register to zero, for the double precision divide.
   C. The divisor ($N_{F.S.}$ - Nz) MSB's register will always be zero.

These schemes have the following advantages:

A. No access to the data buss or address buss is required, by the A/D system.
B. 4 I/O bits completely support the A/D system.
C. Since auto full scale/auto zero are implemented in software and long term drift (aging) effects are eliminated.
D. Software overhead is minimal (typically 30 bytes).
E. Where ratiometric operation is permissible, the 4 external components may be ±5% tolerance, including the power supply.

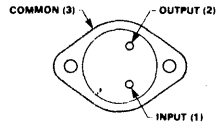
μA78H00/μA78HG SERIES

5 AMP VOLTAGE REGULATOR

FAIRCHILD LINEAR INTEGRATED CIRCUITS

GENERAL DESCRIPTION

Fixed Output – The μA78H00 series hybrids are regulators with fixed output voltages and 5 A output current capability with all the inherent characteristics of the monolithic 3-terminal regulators, i.e., full thermal overload, short-circuit and safe-area protection. The μA78H00 is packaged in a hermetically sealed TO-3 providing 50 W power dissipation. The regulator consists of a monolithic chip driving a discrete series-pass element and two short-circuit detection transistors. A beryllium-oxide substrate is used in conjunction with an isothermal layout to optimize the thermal characteristics of the device and still maintain electrical isolation between the various chips. This unique circuit design limits the maximum junction temperature of the power output transistor to provide full automatic thermal overload protection. If the safe operating area is ever exceeded, the device simply shuts down, rather than failing or damaging other system components. This feature eliminates the need to design costly output circuitry and overly conservative heat sinking arrangements typical of high-current regulators built from discrete components.



Adjustable Regulators – The μA78HG is an adjustable 4-terminal positive voltage regulator capable of supplying in excess of 5 A over a 5.0 V to 24 V output range. The same features and construction details of the μA78H00 series have been incorporated into the μA78HG. Only two (2) external resistors are required to set the output voltage. Input and output capacitors should be used to improve input filtering and transient response.

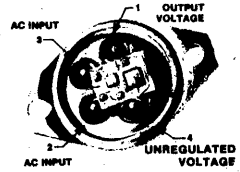
SH1705

5 VOLT, 5 AMP REGULATOR WITH BRIDGE



FAIRCHILD HYBRID PRODUCTS

GENERAL DESCRIPTION — The SH1705 is a 5 V, 5 A regulator with a 5 A diode bridge rectifier contained in the same TO-3 package. With the addition of a power transformer, a filter capacitor and a small bypass capacitor, the SH1705 forms a complete power supply. The regulator section is identical with the μA78H05A and may be used separately from the rectifier.

- **BUILT IN RECTIFIER BRIDGE**
- **5 A OUTPUT CURRENT**
- **INTERNAL CURRENT AND THERMAL LIMITING**
- **LOW DROPOUT VOLTAGE**
- **50 W POWER DISSIPATION**
- **HERMETICALLY SEALED**

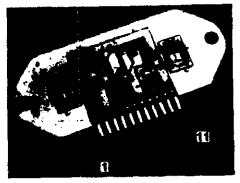
SH3015

SERVO AMPLIFIER AND MOTOR DRIVER

FAIRCHILD HYBRID PRODUCTS



GENERAL DESCRIPTION — The SH3015 is a high-power amplifier designed for applications requiring high currents and high voltage capability. This product is designed to supply up to 6 A continuously to load between ±35 V. The SH3015 incorporates a μA741 Operational Amplifier input with current and voltage gain stages to reach this capability. The design allows the user to set the output current limit to the level required. The SH3015 is stable when driving resistive and inductive loads and the output is protected from voltage transients at the output due to inductive kickback. Output current is selectively limited by placing resistors between the supply pins and the respective current limit pins.

- **INTERNALLY COMPENSATED**
- **PROGRAMMABLE CURRENT LIMITING**
- **STABLE WITH INDUCTIVE LOADS**
- **CASE IS ELECTRICALLY ISOLATED**

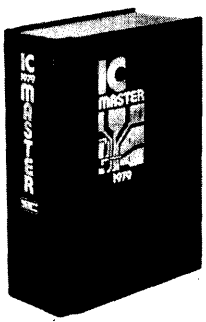
"I need to know if this device exists, and if there are any alternate sources. Where do I start?"

- Memory IC
- RAM
- Static
- 1024x1
- CMOS
- 250 Nanoseconds
- 5 Volts

If you're spending hours to solve a problem similar to the one above, you're behind the times...



It only takes a few seconds with "THE MASTER."

Clear your desk for action with the newly revised 1979 IC Master. Its all-under-one-cover features include: Over 40,000 standard products from more than 87 different companies... five different selection guides (memory, microprocessor, interface, linear and digital.) ... alternate source directory for pin- for- pin, function- for- function replacements ... applications directory... complete military section ... a complete part numbering guide ... etc.

You don't have to search through stacks of catalogs. Simply look up the specs and function you need. You don't need a part number to start with.

All you need is a problem to use The Master. Does the device exist? Who makes it? Is there an alternate source? What's the part number? Is there an applications note? Who is my closest distributor—etc.

HA-909/911

Wideband, Low Noise, Operational Amplifiers

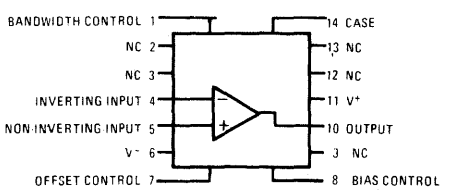
FEATURES

- LOW BROADBAND NOISE — 1μV R.M.S.
- LOW NOISE VOLTAGE — 7nV/$\sqrt{Hz}$
- LOW OFFSET VOLTAGE — 2mV
- WIDE BANDWIDTH — 7MHz
- POWER BANDWIDTH — 20kHz
- SUPPLY RANGE — ±5V TO ±20V
- INTERNALLY COMPENSATED

APPLICATIONS

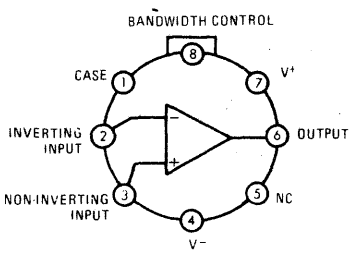
- HIGH Q, WIDEBAND FILTERS
- AUDIO AMPLIFIERS
- SIGNAL GENERATORS

DESCRIPTION



HA-909 and HA-911 are monolithic ampliifers delivering very low noise and excellent bandwidth specifications without the need for external compensation. Additional features of these dielectrically isolated devices include low offset voltage, offset trim capabitlity (14-pin flat package only), and high output current drive capabitlity.

With 7MHz bandwidth and internal compensation these amplifiers are extremely useful in many active filter designs. In audio circuitry requiring quiet operation these devices offer 1 μ V typical broadband noise (10Hz to 1kHz) and 20kHz power bandwidth. 2mV typical offset voltage, offset trim capability, and 20mA output current drive capability (±10.0V swing) make these amplifiers useful in signal conditioning circuits.



HA-909 and HA-911 are available in metal can (TO-99) and 14-pin flat packages. HA-909 is specified over the -55°C to +125°C range. HA-911 is specified from 0°C to +75°C.

HA-2050/2055/2050A 2055A

High Slew Rate F.E.T. Input Operational Amplifiers

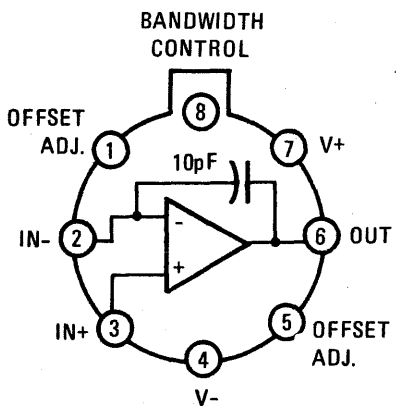
FEATURES

- HIGH SLEW RATE — 120V/μs
- FAST SETTLING — 400ns
- WIDE POWER BANDWIDTH — 2MHz
- HIGH GAIN BANDWIDTH — 20MHz
- HIGH INPUT IMPEDANCE — 10^{12} OHMS
- LOW BIAS CURRENT — 1pA
- TRUE OP AMP – CAN BE OPERATED INVERTING OR NON-INVERTING

APPLICATIONS

- DATA ACQUISITION
- SIGNAL CONDITIONING
- R.F. AND VIDEO AMPLIFICATION

DESCRIPTION



The HA-2050/2055 is an operational amplifier combining the advantages of very high slew rate and wide bandwidth with ultra-low input current and high input resistance. These devices are ideal for use in sample-and-hold circuits, A/D, D/A and sampled data systems; and for use in wide band R.F. or video systems where wide bandwidth at high output levels is required. The device may be operated inverting or noninverting; and external compensation is required only when operated at closed loop gains less than three. An internal feedback capacitor is provided to cancel phase shift in the feedback loop due to input capacitance.

The HA-2050 is guaranteed for operation from -55°C to +125°C and the HA-2055 is guaranteed from 0°C to +75°C.

HA-2060/2065/ 2060A/2065A

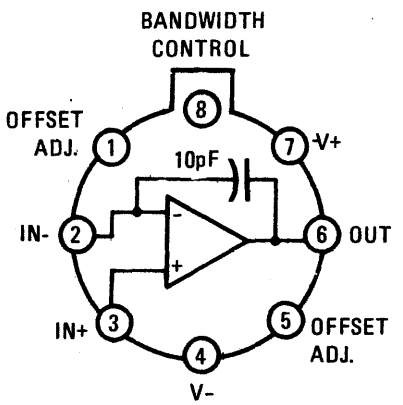
Wide Band F.E.T. Input Operational Amplifier

FEATURES

- GAIN BANDWIDTH PRODUCT 100MHz
- HIGH INPUT IMPEDANCE 10^{12} OHMS
- LOW BIAS CURRENT 1pA
- HIGH SLEW RATE 35V/μs
- WIDE POWER BANDWIDTH 600kHz
- TRUE OP AMP – CAN BE OPERATED INVERTING OR NON-INVERTING

APPLICATIONS

- SIGNAL CONDITIONING
- ACTIVE FILTERS
- SIGNAL GENERATORS



DESCRIPTION

The HA-2060/2065 is an operational amplifier combining the advantages of very wide bandwidth and high slew rate with ultra-low input current and high input resistance. These devices are ideal for use in sample-and-hold circuits, active filters, wide band amplifiers, high gain amplifiers with superior bandwidth, and wherever very low closed loop gain and phase shift errors are required. The device may be operated inverting or noninverting; and external compensation is required only when operating at closed loop gains less than five. An internal feedback capacitor is provided to cancel phase shift in the feedback loop due to input capacitance.

The HA-2060 is guaranteed for operation from -55°C to +125°C and the HA-2065 is guaranteed from 0°C to +75°C.

HA-2400/2404/2405

PRAM™ Four Channel Programmable Amplifier

FEATURES

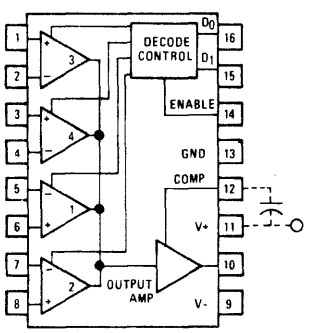
- PROGRAMMABILITY
- HIGH SLEW RATE 30V/μs
- WIDE GAIN BANDWIDTH 40MHz
- HIGH GAIN 150,000
- LOW OFFSET CURRENT 5nA
- HIGH INPUT IMPEDANCE 30MΩ
- SINGLE CAPACITOR COMPENSATION
- DTL/TTL COMPATIBLE INPUTS

APPLICATIONS

- THOUSANDS OF NEW APPLICATIONS; PROGRAM
  - SIGNAL SELECTION/MULTIPLEXING
  - OP AMP GAIN
  - OSCILLATOR FREQUENCY
  - FILTER CHARACTERISTICS
  - ADD-SUBTRACT FUNCTIONS
  - INTEGRATOR CHARACTERISTICS
  - COMPARATOR LEVELS

DESCRIPTION

HA-2400/2404/2405 comprise a series of four-channel programmable amplifiers providing a level of versatility unsurpassed by any other monolithic operational amplifier. Versatility is achieved by employing four input amplifier channels, any one (or none) of which may be electronically selected and connected to a single output stage through DTL/TTL compatible address inputs. The device formed by the output and the selected pair of inputs is an op amp which delivers excellent slew rate, gain bandwidth and power bandwidth performance. Other advantageous features for these dielectrically isolated amplifiers include high voltage gain and input impedance coupled with low input offset voltage and offset current. External compensation is not required on this device at closed loop gains greater than 10.



Each channel of the HA-2400/2404/2405 can be controlled and operated with suitable feedback networks in any of the standard op amp configurations. This specialization makes these amplifiers excellent components for multiplexing, signal selection, and mathematical function designs. With 30V/μs slew rate, 40MHz gain bandwidth, and 30M ohms input impedance these devices are ideal building blocks for signal generators, active filters, and data acquisition designs. Programmability coupled with 2mV typical offset voltage and 5nA offset current makes these amplifiers outstanding components for signal conditioning circuits.

HA-2400/2404/2405 are available in a 16 pin dual-in-line package. HA-2400 is specified from -55°C to +125°C. HA-2404 is specified over the -25°C to +85°C range, while HA-2405 operates from 0°C to +75°C.

HA-2500/02/05

Precision High Slew Rate Operational Amplifiers

FEATURES

- HIGH SLEW RATE 30V/μS
- FAST SETTLING 330ns
- WIDE POWER BANDWIDTH 500kHz
- HIGH GAIN BANDWIDTH 12MHz
- HIGH INPUT IMPEDANCE 100MΩ
- LOW OFFSET CURRENT 10nA
- INTERNALLY COMPENSATED

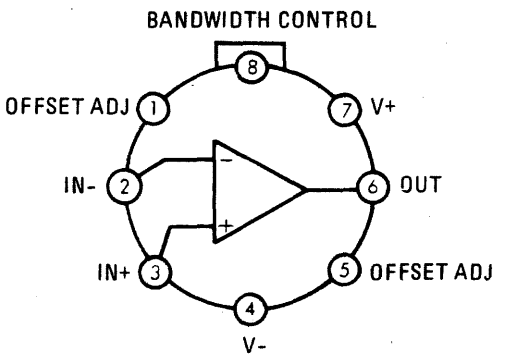
APPLICATIONS

- DATA ACQUISTION SYSTEMS
- R.F. AMPLIFIERS
- VIDEO AMPLIFIERS
- SIGNAL GENERATORS
- PULSE AMPLIFICATION

DESCRIPTION

HA-2500/2502/2505 comprise a series of monolithic operational amplifiers whose designs are optimized to deliver excellent slew rate, bandwidth, and settling time specifications. The outstanding dynamic features of this internally compensated device are complemented with low offset voltage and offset current.

These dielectrically isolated amplifiers are ideally suited for applications such as data acquisition, R.F., video, and pulse conditioning circuits. Slew rate of ±25V/μs and 330ns (0.1%) settling time make these devices excellent components in fast, accurate data acquisition and pulse amplification designs. 12 MHz bandwidth and 500kHz power bandwidth make these devices well suited to R.F. and video applications. With 2mV typical offset voltage plus offset trim capability and 10nA offset current, HA-2500/2502/2505 are particularly useful components in signal conditioning designs.



The gain and offset voltage figures of the HA-2500 series are optimized by internal component value changes while the similar design of the HA-2510 series is maximized for slew rate.

HA-2500/2502/2505 are available in metal can (TO-99) packages. HA-2500 and HA-2502 are specified over the -55°C to +125°C range. HA-2505 is specified from 0°C to +75°C.

HA-2510/2512/2515

High Slew Rate Operational Amplifiers

FEATURES

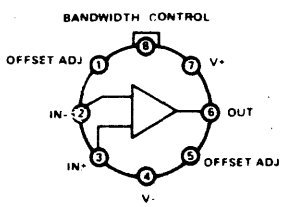
- HIGH SLEW RATE — 60V/μs
- FAST SETTLING — 250ns
- WIDE POWER BANDWIDTH — 1,000kHz
- HIGH GAIN BANDWIDTH — 12MHz
- HIGH INPUT IMPEDANCE — 100MΩ
- LOW OFFSET CURRENT — 10nA
- INTERNALLY COMPENSATED

APPLICATIONS

- DATA ACQUISITION SYSTEMS
- R.F. AMPLIFIERS
- VIDEO AMPLIFIERS
- SIGNAL GENERATORS
- PULSE AMPLIFICATION

DESCRIPTION

The HA-2510/2512/2515 are a series of high performance operational amplifiers which set the standards for maximum slew rate, highest accuracy and widest bandwidth for internally compensated monolithic devices. In addition to excellent dynamic characteristics, these dielectrically isolated amplifiers also offer low offset current and high input impedance.



The ±60V/ μs slew rate and 250ns (0.1%) settling time of these amplifiers is ideally suited for high speed D/A, A/D, and pulse amplification designs. HA-2510/2512/2515's superior 12MHz gain bandwidth and 1000kHz power bandwidth is extremely useful in R.F. and video applications. For accurate signal conditioning these amplifiers also provide 10nA offset current, coupled with 100MΩ input impedance, and offset trim capability.

The HA-2510/2512 are available in metal can (TO-99) and 14-pin flat packages. HA-2510 and HA-2512 are specified from -55°C to +125°C. HA-2515 is specified over the 0°C to +75°C range, and is available in the TO-99 package.

HA-2507/2517/2527

Epoxy-Packaged, High Slew Rate Operational Amplifier Series

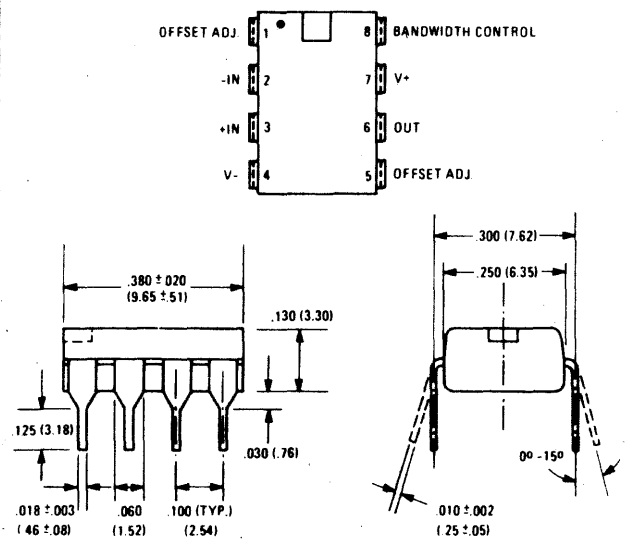
Preliminary

FEATURES

	HA-2507	HA-2517	HA-2527	
• High Slew Rate	30	60	120	V/μs
• Fast Settling	330	250	200	ns
• Wide Power Bandwidth	0.5	1.0	1.6	MHz
• High Gain Bandwidth	12	12	20	MHz
• High Input Impedance	50	100	100	MΩ

APPLICATIONS

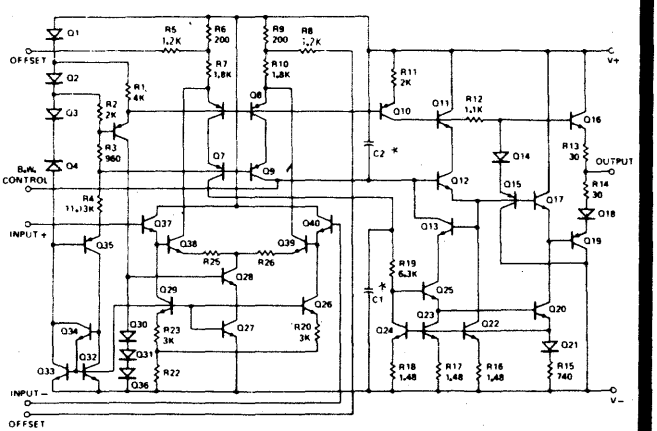
- Pulse Amplification
- Video Amplifiers
- High Speed Test Equipment
- Medical Instrumentation
- Data Acquisition Systems
- Signal Generators



DESCRIPTION

HA-2507/2517/2527 operational amplifiers are a series of high-performance, epoxy-packaged monolithic IC's designed to deliver excellent slew rate, bandwidth and settling time specifications. Typical slew rate specifications for HA-2507, HA-2517 and HA-2527 are 30V/μsec, 60V/μsec and 120V/μsec respectively. Corresponding settling times (10V step to 0.1%) are 330ns, 250ns and 200ns for HA-2507, HA-2517 and HA-2527 respectively. Bandwidths range from 12MHz to 20MHz. This level of performance is achieved through the use of Harris's unique Dielectric Isolation processing techniques. HA-2507/2517/2527 are internally compensated; HA-2507 and HA-2517 are stable for closed loop gains (A_V) greater than or equal to unity. HA-2527 is stable for $A_V > 3$.

This series of op amps affords an economical means of designing high performance equipment for industrial and commercial use. Their slew rate and settling time performance makes them ideally suited for high speed D/A, A/D and pulse amplification designs. The wide bandwidth offered by these devices also makes them valuable components in RF and video applications. HA-2507/2517/2527 also deliver offset current, bias current and offset voltage specifications compatible with the requirements of accurate signal conditioning systems.



The HA-2507/2517/2527 are specified from 0°C to +75°C and are available in 8-lead epoxy DIP packages that have been extensively tested and qualified to deliver the high level of performance and reliability that are expected of Harris Semiconductor's operational amplifiers.

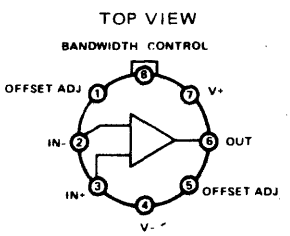
DESCRIPTION



HA-2520/2522/2525 comprise a series of monolithic operational amplifiers delivering an unsurpassed combination of specifications for slew rate, bandwidth and settling time. These dielectrically isolated amplifiers are controlled at closed loop gains greater than 3 without external compensation. In additon, these high performance components also provide low offset current and high input impedance.

120V/μs slew rate and 200ns (0.1%) settling time of these amplifiers make them ideal components for pulse amplification and data acquisition designs. These devices are valuable components for R.F. and video circuitry requiring up to 20MHz gain bandwidth and 2MHz power bandwidth. For accurate signal conditioning designs the HA-2520/2522/2525's superior dynamic specifications are complimented by 10nA offset current, 100MΩ input impedance and offset trim capability.

The HA-2520/2522 are available in metal can (TO-99) and 14-pin flat packages. HA-2520 and HA-2522 are specified over -55°C to +125°C range. HA-2525 is specified from 0°C to +75°C, and is available in the TO-99 package.

HA-2530/2535

High Slew Rate, Wideband Inverting Amplifier

FEATURES

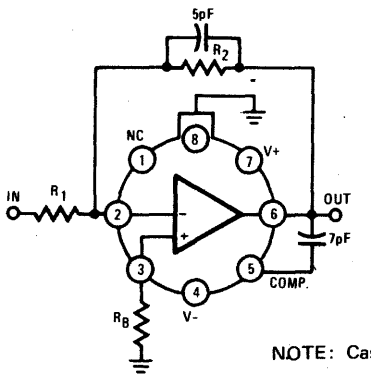
- HIGH SLEW RATE ±320V/μs
- FAST SETTLING TIME 550ns
- WIDE POWER BANDWIDTH 5MHz
- HIGH GAIN BANDWIDTH PRODUCT 70MHz
- LOW OFFSET VOLTAGE 0.8mV
- LOW POWER SUPPLY CURRENT 3.5mA

APPLICATIONS

- PULSE AMPLIFICATION
- SIGNAL CONDITIONING
- SIGNAL GENERATORS
- COAXIAL CABLE DRIVERS
- INTEGRATORS

DESCRIPTION

HA-2530 and HA-2535 are monolithic high speed inverting amplifiers which deliver superior slew rate, bandwidth, and accuracy specifications compared to any other amplifier in its class. Designs of these dielectrically isolated amplifiers utilize the feed forward amplifier technique to produce excellent dynamic and DC specifications coupled with low power consumption. These devices require no external compensation at closed loop gains greater than 10.



These amplifiers are excellent components for pulse circuits, data acquisition designs, and high speed integrators that can take advantage of the ±320V/μs slew rate and 550ns (0.1%) settling time. 70MHz gain bandwidth product, 5MHz power bandwidth coupled with 0.8mV offset voltage and ±50mA typical output current levels make these amplifiers ideally suited for signal conditioning, signal generation, and coaxial driver applications.

The HA-2530 and HA-2535 are available in metal can (TO-99) packages. HA-2530 is specified over the -55°C to +125°C range while HA-2535 is specified from 0°C to +75°C.

HA-2600/2602/2605

Wide Band, High Impedance Operational Amplifier

FEATURES

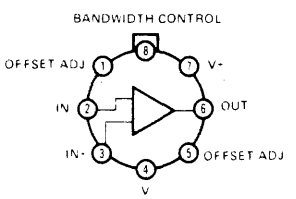
- WIDE BANDWIDTH — 12MHz
- HIGH INPUT IMPEDANCE — 500MΩ
- LOW INPUT BIAS CURRENT — 1nA
- LOW INPUT OFFSET CURRENT — 1nA
- LOW INPUT OFFSET VOLTAGE — 0.5mV
- HIGH GAIN — 150K V/V
- HIGH SLEW RATE — 7V/μs
- OUTPUT SHORT CIRCUIT PROTECTION

APPLICATIONS

- VIDEO AMPLIFIER
- PULSE AMPLIFIER
- AUDIO AMPLIFIERS AND FILTERS
- HIGH-Q ACTIVE FILTERS
- HIGH-SPEED COMPARATORS
- LOW DISTORTION OSCILLATORS

DESCRIPTION

HA-2600/2602/2605 are internally compensated bipolar operational amplifiers that feature very high input impedance (500 MΩ, HA-2600) coupled with wideband AC performance. The high resistance of the input stage is complemented by low offset voltage (0.5mV, HA-2600) and low bias and offset current (1nA, HA-2600) to facilitate accurate signal processing. Input offset can be reduced further by means of an external nulling potentiometer. 12MHz unity gain-bandwidth product, 7V/μs slew rate and 150,000V/V open-loop gain enables HA-2600/2602/2605 to perform high-gain amplification of fast, wideband signals. These dynamic characterisitics, coupled with fast settling times, make these amplifiers ideally suited to pulse amplification designs as well as high frequency (e.g. video) applications. The frequency response of the amplifier can be tailored to exact design requirements by means of an external bandwidth control capacitor.



In addition to its application in pulse and video amplifier designs, HA-2600/2602/2605 is particularly suited to other high performance designs such as high-gain low distortion audio amplifiers, high-Q and wideband active filters and high-speed comparators.

HA-2600 and HA-2602 are guaranteed over -55°C to +125°C. HA-2605 is specified from 0°C to +75°C. All devices are available in TO-99 cans, and HA-2600/2602 are available in 10 lead flat packages.

HA-2607/2627

Epoxy-Packaged, Wide Band Operational Amplifier Series

Preliminary

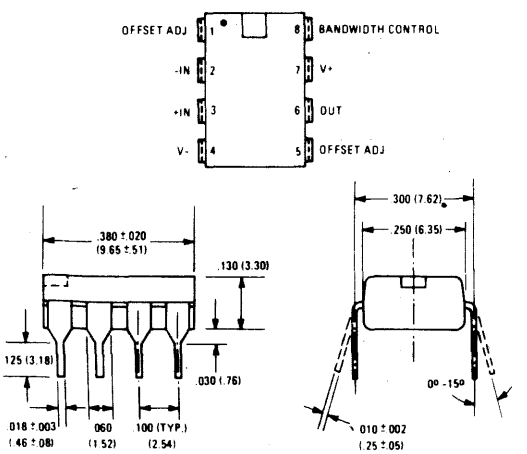
FEATURES

	HA-2607	HA-2627	
● Wide Gain-Bandwidth	12	100	MHz
● High Slew Rate	7	35	V/μ S
● Wide Power Bandwidth	75	600	KHz
● High Gain	150KV/V		
● High Input Impedance	500M Ω		
● Output Short Circuit Protection			

APPLICATIONS

- Pulse Amplification
- Video Amplifiers
- Audio Amplifiers and Filters
- High Speed Test Equipment
- High Speed Comparators

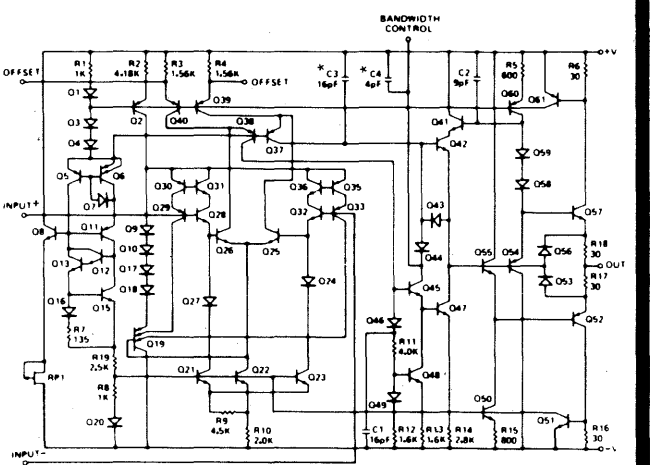
DESCRIPTION



HA-2607/2627 bipolar operational amplifiers are high performance, epoxy-packaged monolithic IC's designed to deliver outstanding wideband AC performance. HA-2607 has a specified bandwidth of 12MHz while HA-2627 has a typical gain-bandwidth of 100MHz!* HA-2607 and HA-2627 also offer correspondingly high slew rates of 7V/μ Sec and 35V/μ Sec respectively. These dynamic characteristics, coupled with 150,000V/V open-loop gain enables HA-2607/2627 to perform high-gain amplification of very fast, wideband signals. This level of performance is achieved through the use of Harris' unique Dielectric Isolation processing techniques.

The HA-2607 and HA-2627 op amps afford an economical means of designing high performance equipment for industrial and commercial use. These amplifiers are ideally suited to pulse amplification designs as well as high frequency (e.g. RF, video) applications. The frequency response of both amplifiers can be tailored to exact design requirements by means of an external bandwidth control capacitor.

HA-2607/2627 are specified from 0°C to +75°C and are available in 8-lead epoxy DIP packages that have been extensively tested and qualified to deliver the high level of performance and reliability that are expected of Harris Semiconductor's operational amplifiers.



*HA-2607/2627 are internally compensated – HA-2607 is stable for $A_V \geq 1$, – HA- 2627 is stable for $A_V \geq 5$.

HA-2630/2635

High Performance Current Booster

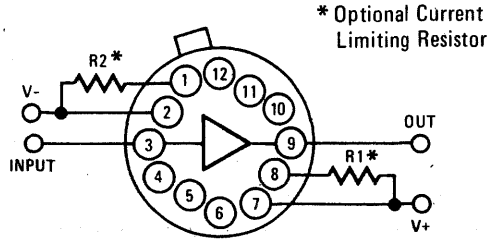
FEATURES

- OUTPUT CURRENT ±400mA
- SLEW RATE 500V/μs
- BANDWIDTH 8MHz
- FULL POWER BANDWIDTH 8MHz
- INPUT RESISTANCE $2.0 \times 10^6 \Omega$
- OUTPUT RESISTANCE 2.0Ω
- POWER SUPPLY RANGE ±5V to ±20V
- PACKAGE IS ELECTRICALLY ISOLATED

APPLICATIONS

- COAXIAL CABLE DRIVERS
- AUDIO OUTPUT AMPLIFIERS
- SERVO MOTOR DRIVERS
- POWER SUPPLIES (BIPOLAR)
- PRECISION DATA RECORDING

DESCRIPTION



HA-2630 and HA-2635 are monolithic, unity voltage gain current amplifiers delivering extremely high slew rate, wide bandwidth, and full power bandwidth even under heavy output loading conditions. This dielectrically isolated current booster also offers high input impedance and low output resistance. These devices are intended to be used in series with an operational amplifier and inside the feedback loop whenever additional output current is required. Output current levels are programmable by selecting two optional external resistors.

These current amplifiers offer an exceptional 500V/μs slew rate and 8MHz bandwidth which allows them to be used with many high performance op amps in precision data recording and high speed coaxial cable driver designs. 2.0M ohm input resistance and 2 ohm output resistance coupled with ±400mA output current make HA-2630 and HA-2635 ideal components in high fidelity audio output amplifier designs.

HA-2630 and HA-2635 are available in an electrically isolated TO-8 type can for ease of mounting with or without a heat sink. HA-2630 is specified over the -55°C to +125°C range. HA-2635 is specified from 0°C to +75°C.

HA-2640/2645

High Voltage Operational Amplifier

FEATURES

- OUTPUT VOLTAGE SWING ±35V
- SUPPLY VOLTAGE ±10V TO ±40V
- OFFSET CURRENT 5nA
- BANDWIDTH 4MHz
- SLEW RATE 5V/μs
- COMMON MODE INPUT VOLTAGE SWING ±35V
- OUTPUT OVERLOAD PROTECTION

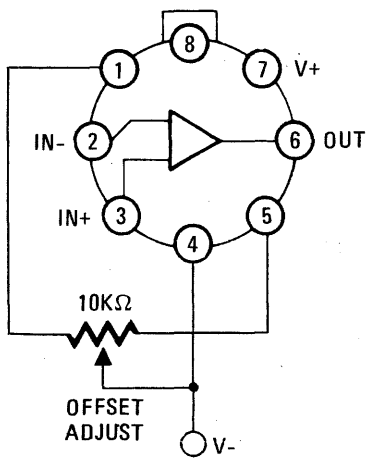
APPLICATIONS

- INDUSTRIAL CONTROL SYSTEMS
- POWER SUPPLIES
- HIGH VOLTAGE REGULATORS
- RESOLVER EXCITATION
- SIGNAL CONDITIONING

DESCRIPTION

HA-2640 and HA-2645 are monolithic operational amplifiers which are designed to deliver unprecedented dynamic specifications for a high voltage internally compensated device. These dielectrically isolated devices offer very low values for offset voltage and offset current coupled with large output voltage swing and common mode input voltage.

For maximum reliability, these amplifiers offer unconditional output overload protection through current limiting and a chip temperature sensing circuit. This sensing device turns the amplifier "off", when the chip reaches a certain temperature level.



These amplifers deliver ±35V common mode input voltage swing, ±35V output voltage swing, and up to ±40V supply range for use in such designs as regulators, power supplies, and industrial control systems. 4MHz gain bandwidth and 5V/μs slew rate make these devices excellent components for high performance signal conditioning applications. Outstanding input and output voltage swings coupled with a low 5nA offset current make these amplifiers excellent components for resolver excitation designs.

HA-2640 and HA-2645 are available in metal can (TO-99) packages and can be used as high performance pin-to-pin replacements for many general purpose op amps. HA-2640 is specified from -55°C to +125°C and HA-2645 is specified over the 0°C to +75°C range.

HA-2650/2655

Dual High Performance Operational Amplifier

FEATURES

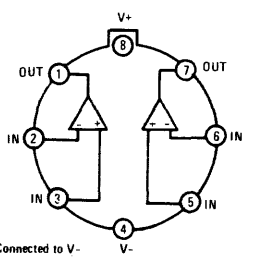
• SLEW RATE	5V/μs
• BANDWIDTH	8MHz
• BIAS CURRENT	35nA
• AV. OFFSET VOLTAGE DRIFT	8μV/°C
• POWER CONSUMPTION	75mW
• SUPPLY VOLTAGE RANGE	±2V TO ±20V

APPLICATIONS

- VIDEO AMPLIFIERS
- HIGH IMPEDANCE, WIDEBAND BUFFERS
- INTEGRATORS
- AUDIO AMPLIFIERS
- ACTIVE FILTERS

DESCRIPTION

HA-2650/2655 contains two internally compensated operational amplifiers offering high slew rate and high frequency performance combined with exceptional DC characteristics. 5V/μ sec slew rate and 8MHz bandwidth make these amplifiers suitable for processing fast, wideband signals extending into the video frequency spectrum. Signal processing accuracy is enhanced by front-end performance that includes 1.5mV offset voltage, 8 μ V/°C offset voltage drift and low offset and bias current (1nA and 35nA respectively). Offset voltage can be trimmed to zero on the devices offered in dual-in-line packages. Signal conditioning is further enhanced by 500MΩ input impedance.



Applications for HA-2650/2655 include video circuit designs such as high impedance buffers, integrators, tone generators and filters. These amplifiers are also ideal components for active filtering of audio and voice signals.

HA-2650/2655 are offered in 14 pin D.I.P. and metal TO-99 packages and are also available in dice form. HA-2650 is specified from -55°C to +125°C. HA-2655 operates from 0°C to +75°C.

HA-2700/2704/2705

Low Power, High Performance Operational Amplifiers

FEATURES

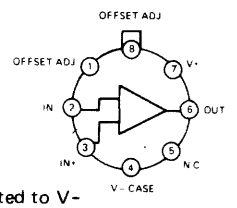
- LOW POWER DISSIPATION — 2.24mW AT ±15.0V
- HIGH SLEW RATE — 20V/μs
- HIGH OPEN LOOP GAIN — 300K(R_L = 2KΩ)
- LOW INPUT BIAS CURRENT — 5nA
- LOW OFFSET VOLTAGE — 0.5mV
- HIGH CM_{rr} — 106dB
- WIDE POWER SUPPLY RANGE — ±5.5V TO ±20.0V

APPLICATIONS

- HIGH GAIN AMPLIFIER
- INSTRUMENTATION AMPLIFIERS
- ACTIVE FILTERS
- TELEMETRY SYSTEMS
- BATTERY-POWERED EQUIPMENT

DESCRIPTION

HA-2700/2704/2705 are ihternally compensated operational amplifiers which employ dielectric isolation to achieve excellent DC and dynamic performance with very low quiescent power consumption.



DC performance of the amplifier input is characterized by high CMRR (106dB), low offset voltage (0.5mV, HA-2700 and HA-2704; 1mV, HA-2705) along with low bias and offset current (5.0nA and 2.5nA respectively). These input specifications, in conjunction with offset null capability and open-loop gain of 300,000V/V, enable HA-2700/2704/2705 to provide accurate, high-gain signal amplification. Gain bandwidth 1MHz and slew rate of 20V/μs allow for processing of fast, wideband signals. Input and output signal amplitudes of at least ±11 volts can be accomodated while providing output drive capability of 10mA. For maximum reliability, the output is protected in the event of short circuits to ground.

These amplifiers operate from a wide range of supplies (±5.5V to ±20V) with a maximum quiescent supply drain of only 150μA. HA-2700/2704/2705 are, therefore, ideally suited to low-power instrumentation and filtering applications that require fast, accurate response over a wide range of signal frequency.

These amplifers are available in three performance grades: HA-2700 is rated for operation from -55°C to +125°C; HA-2704 is specified over -25°C to +85°C; HA-2705 is specified from 0°C to +75°C. All three devices are available in TO-99 cans or 14 lead D.I.P. packages.

HA-2720/25

Wide Range Programmable Operational Amplifier

FEATURES

WIDE PROGRAMMING RANGE

SLEW RATE	0.06 TO 6V/μs
BANDWIDTH	5kHz TO 10MHz
BIAS CURRENT	0.4 TO 50nA
SUPPLY CURRENT	1μA TO 1.5mA

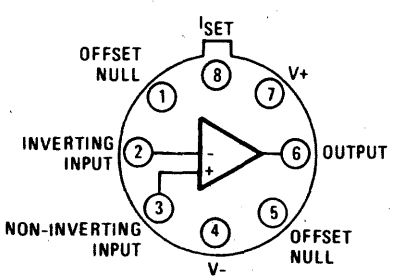
- WIDE POWER SUPPLY RANGE ±1.2 TO ±18V
- CONSTANT AC PERFORMANCE OVER SUPPLY RANGE

APPLICATIONS

- ACTIVE FILTERS
- CURRENT CONTROLLED OSCILLATORS
- VARIABLE ACTIVE FILTERS
- MODULATORS
- BATTERY-POWERED EQUIPMENT

DESCRIPTION

HA-2720/2725 programmable amplifiers are internally compensated monolithic devices offering a wide range of performance, that can be controlled by adjusting the circuits' "set" current (I_{SET}). By means of adjusting an external resistor or current source, power dissipation, slew rate, bandwidth, output current and input noise can be programmed to desired levels. This versatile adjustment capability enables HA-2720/2725 to provide optimum design solutions by delivering the required level of performance with minimum possible power dissipation. HA-2720 and HA-2725 can, therefore, be utilized as the standard amplifier for a variety of designs simply by adjusting their programming current.



A major advantage of HA-2720/2725 is that operating characteristics remain virtually constant over a wide supply range (±1.2V to ±15V), allowing the amplifiers to offer maximum performance in almost any system including battery-operated equipment. A primary application for HA-2720/2725 is in active filters for a wide variety of signals that differ in frequency and amplitude. Also, by modulating the "set" current, HA-2720/2725 can be used for designs such as current controlled oscillators modulators, sample and hold circuits and variable active filters.

HA-2720 is guaranteed over -55°C to +125°C. HA-2725 is specified from 0°C to +75°C. Both parts are available in TO-99 cans or dice form.

HA-2730/35

Wide Range Dual Programmable Operational Amplifier

FEATURES

- WIDE PROGRAMMING RANGE

SET CURRENT	0.1 TO 100μA
SLEW RATE	0.06 TO 6V/μs
BANDWIDTH	5kHz TO 10MHz
BIAS CURRENT	0.4 TO 50nA
SUPPLY CURRENT	1μA TO 1.5mA

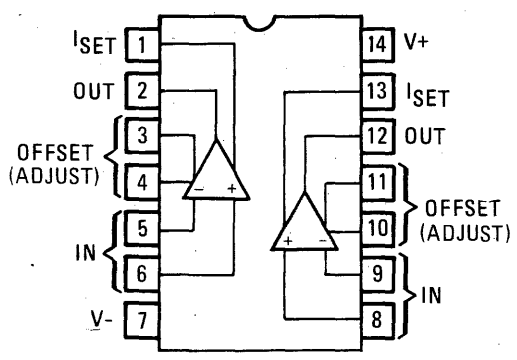
- WIDE POWER SUPPLY RANGE $^{+}$1.2 TO $^{+}$18V
- CONSTANT AC PERFORMANCE OVER SUPPLY RANGE

APPLICATIONS

- ACTIVE FILTERS
- CURRENT CONTROLLED OSCILLATORS
- VARIABLE ACTIVE FILTERS
- MODULATORS
- BATTERY-POWERED EQUIPMENT

DESCRIPTION

HA-2730/2735 Dual Programmable Amplifiers are internally compensated monolithic devices offering a wide range of performance, that can be controlled by adjusting the circuits' "set" current (I_{SET}). By means of adjusting an external resistor or current source, power dissipation, slew rate, bandwidth, output current and input noise can be programmed to desired levels. Each amplifier on the chip can be adjusted independently. This versatile adjustment capability enables HA-2730/2735 to provide optimum design solutions by delivering the required level of performance with minimum possible power dissipation. HA-2730/2735 can, therefore, be utilized as the standard amplifier for a variety of designs simply by adjusting their programming current.



A major advantage of HA-2730/2735 is that operating characteristics remain virtually constant over a wide supply range (±1.2V to ±15V), allowing the amplifiers to offer maximum performance in almost any system including battery-operated equipement. A primary application for HA-2730/2735 is in active filters for a wide variety of signals that differ in frequency and amplitude. Also, by modulating the "set" current, HA-2730/2735 can be used for designs such as current controlled oscillators, modulators, sample and hold circuits and variable active filters.

HA-2730 is guaranteed over -55°C to +125°C. HA-2735 is specified from 0°C to +75°C. Both parts are available in 14 lead D.I.P. package or dice form.

HA-2900/04/05

Chopper Stabilized Operational Amplifier

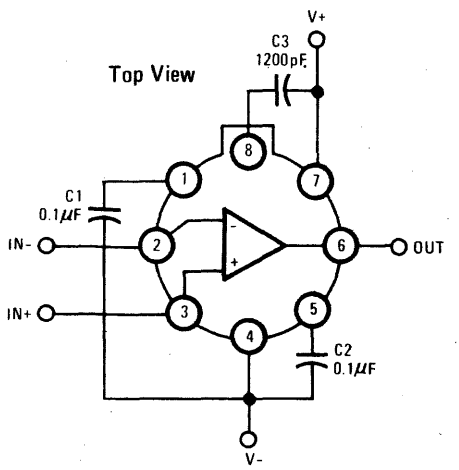
FEATURES

- OFFSET VOLTAGE DRIFT 0.2 μV/°C
- OFFSET CURRENT DRIFT 1pA/°C
- OPEN LOOP GAIN 5×10^8
- BANDWIDTH 3MHz
- SLEW RATE 2.5V/μs
- TRUE DIFFERENTIAL INPUTS

APPLICATIONS

- HIGH-GAIN DC INSTRUMENTATION
- HIGH-ACCURACY WEIGHING EQUIPMENT
- BIOMEDICAL AMPLIFIERS
- PRECISION INTEGRATORS AND TIMERS

DESCRIPTION



HA-2900/2904/2905 are monolithic chopper-stabilized operational amplifiers that employ dielectric isolation achieving superior offset drift, extremely low input currents and excellent AC performance. Input drift is characterized by offset voltage drift of 0.2 μV/°C and offset current drift of 1pA/°C. Initial offset voltage is only 20 μV while offset current is 50pA. These input specifications make HA-2900/2904/2905 ideally suited to high accuracy applications such as high-gain DC instrumentation, and precision integration. The amplifiers can be used to replace other op amps in designs where much lower errors are required without external adjustments. 3MHz gain-bandwidth product makes HA-2900/2904/2905 valuable for processing wide band signals as well as for low frequency measurements.

In addition to offering high-accuracy performance, these "choppers" also offer versatility by virtue of their symmetrical, differential inputs which permit operation in any op amp configuration – inverting, non-inverting or balanced. These devices require only three external capacitors for proper operation.

HA-2900 is guaranteed over -55°C to +125°C; HA-2904 operates from -25°C to +85°C; HA-2905 operates from 0°C to +75°C. All devices are available in a hermetically sealed metal can.

HA-4602/4605

High Performance Quad Operational Amplifier

FEATURES

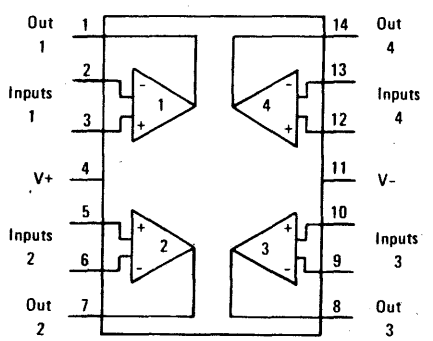
- LOW OFFSET VOLTAGE 0.3mV
- HIGH SLEW RATE ±4V/μs
- WIDE BANDWIDTH 8MHz
- LOW DRIFT 2μV/°C
- FAST SETTLING (0.01%, 10V STEP) 4.2μs
- LOW POWER CONSUMPTION 35mW/AMP
- SUPPLY RANGE ±5V TO ±20V

APPLICATIONS

- HIGH Q, WIDE BAND FILTERS
- INSTRUMENTATION AMPLIFIERS
- AUDIO AMPLIFIERS
- DATA ACQUISITION SYSTEMS
- INTEGRATORS
- ABSOLUTE VALUE CIRCUITS
- TONE DETECTORS

DESCRIPTION

The HA-4602 and HA-4605 are high performance dielectrically isolated monolithic quad operational amplifiers with superior specifications not previously available in a quad amplifier. These amplifiers offer excellent dynamic performance coupled with low values for offset voltage and drift, input noise voltage and power consumption.



A wide range of applications can be achieved by using the features made available by the HA-4602/4605. With wide bandwidth (8MHz), low power (35mW/amp), and internal compensation, these devices are ideally suited for precision active filter designs. For audio applications these amplifiers offer low noise ($8nV/\sqrt{Hz}$) and excellent full power bandwidth (60kHz). The HA-4602/4605 is particularly useful in designs requiring low offset voltage (0.3mV) and drift (2 μV/°C), such as instrumentation and signal conditioning circuits. The high slew rate (4V/μs) and fast settling time (4.2 μs to 0.01%, 10V step) makes these amplifiers useful components in fast, accurate data acquisition systems.

The HA-4602 and 4605's are available in 14 pin CERDIP packages which are interchangeable with most other quad op amps. HA-4602 is specified from -55°C to +125°C, and HA-4605 is specified over 0°C to +75°C range.

HA-4622/4625

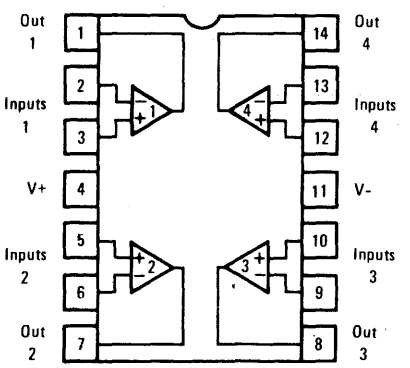
Wide Band, High Performance Quad Operational Amplifier

FEATURES

- Wide Gain Bandwidth Product — 70MHz
- High Slew Rate — ±20V/μs
- Low Offset Voltage — 0.3V
- Fast Settling (0.01%, 10V Step) — 2.5μs
- Total Harmonic Distortion — <.01% to 30kHz
- Low Drift — 2μV/°C
- Low Power Consumption — 35mW/Amp
- Supply Range — ±5V to ±20V

APPLICATIONS

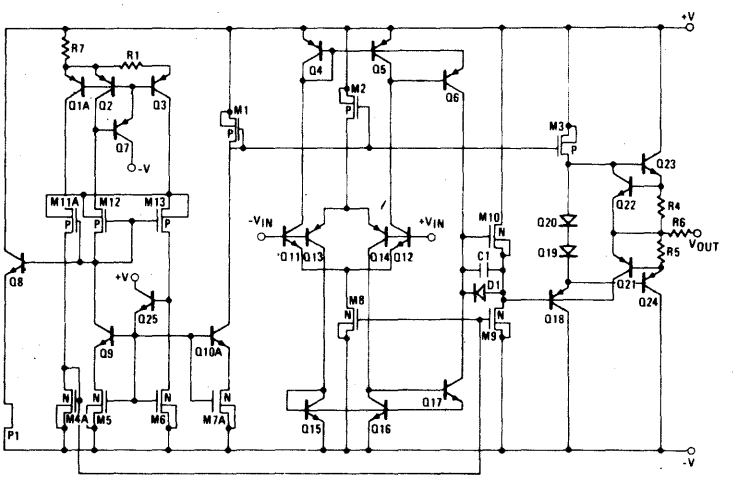
- High Q Wide Band Filters
- Pulse Amplifiers
- Audio Amplifiers
- Data Acquisition Systems
- Absolute Value Circuits
- Video and R.F. Amplifiers



DESCRIPTION

The HA-4622 and HA-4625 are wide band quad operational amplifiers featuring high slew rate, wide bandwidth and fast settling time specifications complemented by low input offset voltage, low drift and input noise voltage.

These dielectrically isolated devices are optimized to offer excellent features suitable for applications where a gain of 10 or greater is to be used. The 35mW/amp and a 70MHz gain-bandwidth-product make these monolithic amplifiers valuable components for many active filter circuits. HA-4622/4625 offer 0.3mV offset voltages and 2 μV/°C offset voltage drift for very accurate signal conditioning designs. In high performance audio applications, these amplifiers deliver 260kHz full power bandwidth and 8nV/$\sqrt{\text{Hz}}$ noise voltage. For fast accurate data acquisition systems HA-4622/4625 offer 20V/μs settling time to 0.01% using a 10V output step.



HA-4622 and HA-4625 are available in 14 pin CERDIP packages and are interchangeable with most other quad op amps. HA-4625 is also available in chip form. The HA-4622 specifications are given for operation from -55°C to +125°C while HA-4625 is specified for operation over the 0°C to +75°C range.

*100% tested for HA1-4622-8

NOTES:

1. Absolute maximum ratings are limiting values, applied individually, beyond which the serviceability of the circuit may be impaired. Functional operability under any of these conditions is not necessarily implied.
2. For supply voltages $< \pm 15V$, the absolute maximum input voltage is equal to the supply voltage.
3. Any one amplifier may be shorted to ground indefinitely.
4. Derate 5.8mW/°C above T_A = +25°C.
5. $V_{OUT} = \pm 10V$, R_L = 2K.
6. $V = \pm 5.0V$.
7. Channel separation value is referred to the input of the amplifier. Input test conditions are: f = 10kHz; V_{IN} = 200mV peak to peak; R_S = 1KΩ. (Refer to Channel Separation vs. Frequency Curve for test circuits.)
8. A_V = 10; R_L = 2K; $C_L \leq$ 10pF.
9. Full power bandwidth is guaranteed by equation:
   $$\text{Full power bandwidth} = \frac{\text{Slew Rate}}{2\pi\ V\text{Peak}}$$
10. Output current is measured with $V_{OUT} = \pm 5V$.
11. Refer to Test Circuits section of the data sheet.
12. Settling time is measured to 0.01% of final value for a 1 volt input step, and A_V = -10.

HA-4741

Quad Operational Amplifier

FEATURES

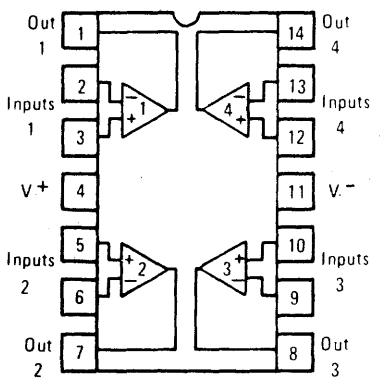
- SLEW RATE 1.6V/μs (TYP.)
- BANDWIDTH 3.5MHz (TYP.)
- INPUT VOLTAGE NOISE 9nV/$\sqrt{Hz}$ (TYP.)
- INPUT OFFSET VOLTAGE 0.5mV (TYP.)
- INPUT BIAS CURRENT 60nA (TYP.)
- SUPPLY RANGE ±2V TO ±20V
- NO CROSSOVER DISTORTION
- STANDARD QUAD PIN-OUT

APPLICATIONS

- UNIVERSAL ACTIVE FILTERS
- D3 COMMUNICATIONS FILTERS
- AUDIO AMPLIFIERS
- BATTERY-POWERED EQUIPMENT

DESCRIPTION

The HA-4741, which contains four amplifiers on a monolithic chip, provides a new measure of performance for general purpose operational amplifiers. Each amplifier in the HA-4741 has operating specifications that equal or exceed those of the 741-type amplifier in all categories of performance.



HA-4741 is well suited to applications requiring accurate signal processing by virtue of its low values of input offset voltage (0.5mV), input bias current (60nA) and input voltage noise (9nV/ $\sqrt{Hz}$ at 1kHz). 3.5MHz bandwidth, coupled with high open-loop gain, allow the HA-4741 to be used in designs requiring amplification of wide band signals, such as audio amplifiers. Audio application is further enhanced by the HA-4741's negligible output crossover distortion. These excellent dynamic characteristics also make the HA-4741 ideal for a wide range of active filter designs. Performance integrity of multi-channel designs is assured by a high level of amplifier-to-amplifier isolation (108dB at 1kHz).

A wide range of supply voltages (±2V to ±20V) can be used to power the HA-4741, making it compatible with almost any system including battery-powered equipment.

The HA-4741 has guaranteed operation over -55°C to +125°C and can be furnished to meet MIL-STD-883 (HA-4741-8). The HA-4741-5 is guaranteed over 0°C to +75°C and is available in ceramic and plastic dual-in-line packages and in dice form.

HA-5100/5105

Wideband, JFET Input, Operational Amplifier

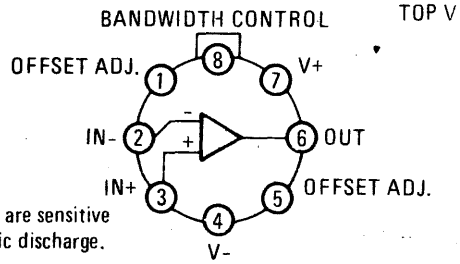
TYPICAL PERFORMANCE PARAMETERS

• Low Input Offset Voltage	0.5mV
• Low Offset Drift	5μV/°C
• Low Input Bias Current	50pA
• Large Voltage Gain	150K V/V
• Wide Bandwidth	18MHz
• High Slew Rate	8V/μsec
• Fast Large Signal Settling Time	1.7μsec

GENERAL DESCRIPTION

The HA-5100/5105 are monolithic wideband operational amplifiers manufactured with FET/Bipolar technologies and dielectric isolation. Precision laser trimming of the input stage complements the amplifier high frequency capabilities with excellent input characteristics.

These devices feature superior bandwidth, high slew rate, very low input offset voltage, very low input bias current, extremely high input impedance and fast settling time. Therefore, these amplifiers are most suitable for precision, high speed data acquisition system designs and for a wide variety of signal conditioning applications.*



*-2 denotes a range of -55°C to 125°C and -5 denotes a 0°C to 70°C range.

APPLICATIONS

- Precision, High Speed, Data Acquisition Systems
- Precise Signal Generation
- Pulse Amplification

HA-5110/5115

Wideband, JFET Input, Uncompensated, Operational Amplifier

PRELIMINARY

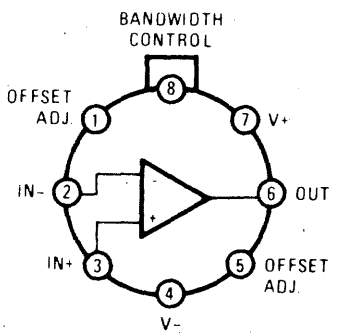
FEATURES

- WIDE GAIN BANDWIDTH 60MHz
- HIGH SLEW RATE 50V/μs
- SETTLING TIME 850ns
- POWER BANDWIDTH 800KHz
- OFFSET VOLTAGE 0.5mV
- BIAS CURRENT 50pA

APPLICATIONS

- VIDEO AND RF AMPLIFIERS
- DATA ACQUISITION
- PULSE AMPLIFIERS
- PRECISION SIGNAL GENERATION

DESCRIPTION



HA-5110/5115 are wideband, uncompensated, operational amplifiers manufactured with FET/Bipolar technologies and dielectric isolation. These monolithic amplifiers feature superior high frequency capabilities further enhanced by precision laser trimming of the input stage to provide excellent input characteristics. These devices are controlled at closed loop gains greater than 10 without compensation.

With excellent dynamic and input characteristics, HA-5110/5115 are well suited for many wideband, pulse, and video applications. These amplifiers are ideal components for video and RF circuitry requiring up to 60MHz gain-bandwidth-product and 800KHz power bandwidth. 50V/μs slew rate and 850ns settling time make these devices useful in pulse amplification and data acquisition designs. HA-5110/5115's 0.5mV offset voltage, 10pA offset current, and extremely high impedance coupled with excellent AC parameters make these amplifiers ideal selections for accurate signal conditioning designs. For applications requiring less critical input characteristics, HA-5115 is available in untrimmed form.

HA-5110/5115 are available in metal can (TO-99) packages. Suffix -2 denotes a range to -55°C to +125°C and -5 denotes a 0°C to +75°C range.

GENERAL DESCRIPTION

HA-5190/5195 are monolithic operational amplifiers featuring an ultimate combination of speed, precision, and bandwidth. Employing monolithic bipolar construction coupled with dielectric isolation, these devices are capable of delivering an unparalled 200V/μs slew rate with a settling time of 70ns (0.1%, 5V output step .) These truly differential amplifiers are designed to operate at gains $\geq$ 5 without the need for external compensation. Other outstanding HA-5190/5195 features are 150MHz gain-bandwidth-product and 6.5MHz full power bandwidth. In addition to these dynamic characteristics, these amplifiers also have excellent input characteristics such as 5mV offset voltage and 15nV input voltage noise (at 1kHz).

With 200V/μs slew rate and 70ns settling time, these devices make ideal output amplifiers for accurate, high speed D/A converters or the main components in high speed sample/hold circuits. 150MHz gain-bandwidth-product, 6.5MHz power bandwidth, and 5mV offset voltage make HA-5190/5195 ideally suited for a variety of pulse and wideband video amplifier applications.

In temperature applications above +75°C, a heat sink is required for HA-5190. THERMALLOY model 6011 or 6012 is recommended. HA-5190 is specified over the -55°C to +125°C range while HA-5195 is specified from 0°C to +75°C.

HA-4900/4905

Precision Quad Comparator

FEATURES

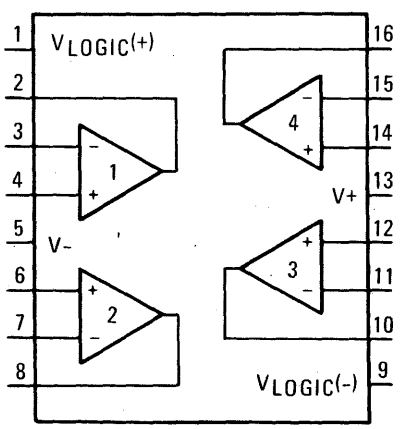
- FAST RESPONSE TIME 130ns
- LOW OFFSET VOLTAGE 2.0mV
- LOW OFFSET CURRENT 10nA
- SINGLE OR DUAL-VOLTAGE SUPPLY OPERATION
- SELECTABLE OUTPUT LOGIC LEVELS
- ACTIVE PULL-UP/PULL-DOWN OUTPUT CIRCUIT - NO EXTERNAL RESISTORS REQUIRED

APPLICATIONS

- THRESHOLD DETECTOR
- ZERO-CROSSING DETECTOR
- WINDOW DETECTOR
- ANALOG INTERFACES FOR MICROPROCESSORS
- HIGH STABILITY OSCILLATORS
- LOGIC SYSTEM INTERFACES

DESCRIPTION

The HA-4900/4905 are monolithic, quad, precision comparators offering fast response time, low offset voltage, low offset current, and virtually no channel-to-channel crosstalk for applications requiring accurate, high speed, signal level detection. These comparators can sense signals at ground level while being operated from either a single +5 volt supply (digital systems) or from dual supplies (analog networks) up to ±15 volts. The HA-4900/4905 contains a unique current driven output stage which can be connected to logic system supplies (V_{Logic}^+ and V_{Logic}^-) to make the output levels directly compatible (no external components needed) with any standard logic or special system logic levels. In combination analog/digital systems, the design employed in the HA-4900/4905 input and output stages prevents troublesome ground coupling of signals between analog and digital portions of the system.



These comparators' combination of features makes them ideal components for signal detection and processing in data acquisition systems, test equipment, and microprocessor/analog signal interface networks.

Both devices are available in 16 pin dual-in-line ceramic packages. The HA-4900 operates from -55°C to +125°C and the HA-4905 operates over a 0°C to +75°C temperature range.

HA-4920/4925

High Speed Quad Comparator

Preliminary

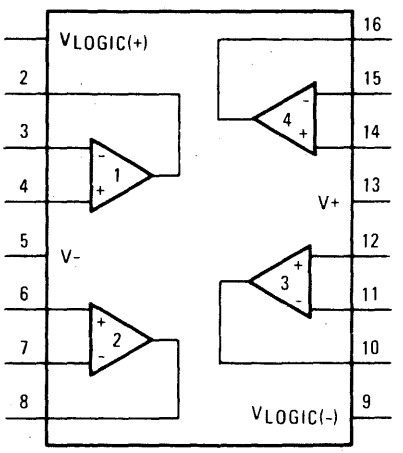
FEATURES

- FAST RESPONSE TIME
- LOW OFFSET VOLTAGE
- STANDARD POWER SUPPLIES
- ACTIVE PULL-UP/PULL-DOWN OUTPUT CIRCUIT – NO EXTERNAL RESISTORS REQUIRED
- TTL AND ECL COMPATIBLE

APPLICATIONS

- A/D CONVERTERS
- THRESHOLD DETECTOR
- ZERO-CROSSING DETECTOR
- LOGIC SYSTEM INTERFACES
- HIGH FREQUENCY OSCILLATORS

DESCRIPTION



HA-4920/4925 are monolithic, quad, high speed comparators offering a combination of speed, precision, and flexibility never before available in a quad comparator. 40ns response time and 2.0mV offset voltage makes these comparators ideally suited for precise signal level detection and fast response times to large and small input signal levels. These dielectrically isolated devices employ unique input/output stages which prevent troublesome ground coupling inherent in combined analog/digital systems.

The flexibility/speed of HA-4920/4925 assures easy application in fast data acquisition systems, analog to logic interface networks, and test equipment.

Both devices are available in 16 pin dual-in-line ceramic packages. The HA-4920 operates from -55°C to +125°C and the HA-4925 operates over a 0°C to +75°C temperature range.

HA-1600-5

Precision Voltage Reference

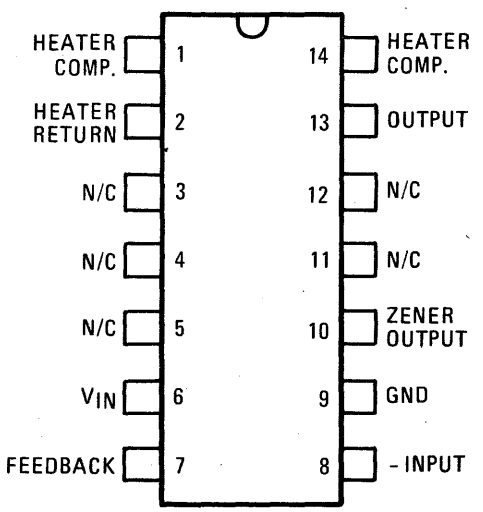
FEATURES

- MONOLITHIC CONSTRUCTION
- EXCELLENT TEMPERATURE STABILITY . . ±1ppm/°C
- LOW NOISE . . . . . 100μV_{p-p}
- WIDE INPUT RANGE . . . . . 12V to 20V

APPLICATIONS

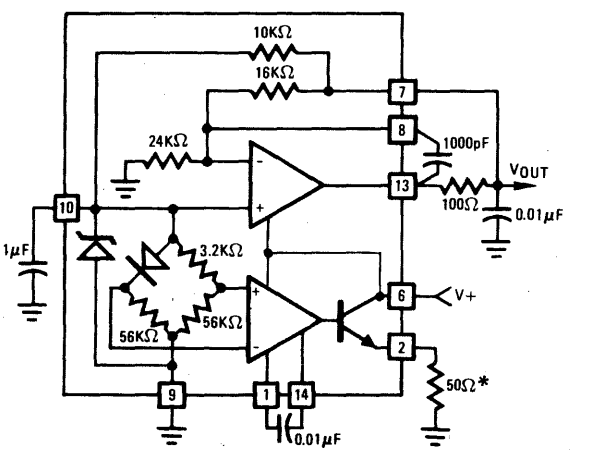
- EXTERNAL VOLTAGE REFERENCE FOR DATA CONVERTERS (D/A OR A/D)
- COMPARATOR REFERENCE
- VOLTAGE REGULATOR REFERENCE

DESCRIPTION



The Harris HA-1600 is a monolithic, temperature regulated +10V precision voltage reference, packaged in a 14 pin DIP. The chip temperature is sensed and regulated by a high gain differential amplifier to achieve a typical temperature coefficient of +1ppm/°C over the specified temperature range.

The I.C. chip is thermally isolated from the package to provide fast warm-up with minimum power drain. The output of the HA-1600 is laser trimmed to provide a precision +10V out.



The HA-1600 accepts an unregulated 12V to 20V, DC input voltage and provides a very accurate +10V DC output at a maximum of 2mA load current. An external amplifier may be connected inside the feedback loop for higher output current. The characteristics of this voltage reference make it an ideal choice for applications where high precision and high stability is a necessity, such as the external voltage reference for a 12 bit D/A converter.

HA-1610

+10V Precision Voltage Reference

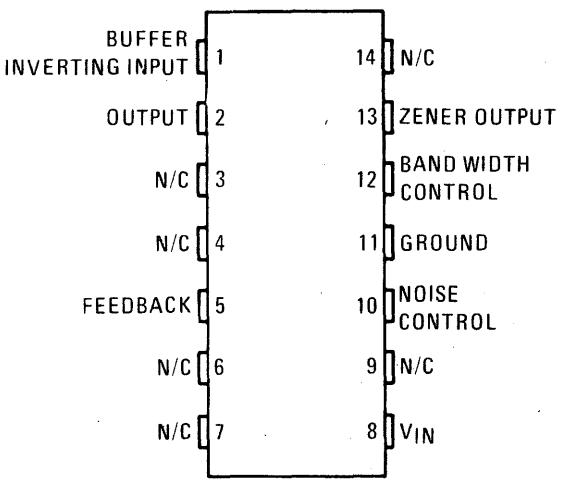
Preliminary

FEATURES

- MONOLITHIC CONSTRUCTION
- INITIAL ACCURACY +10V ±0.01%
- EXCELLENT TEMPERATURE STABILITY ±5ppm/°C MAX
- LOW NOISE 100 μV_{p-p}
- WIDE INPUT RANGE 12V TO 30V
- OUTPUT SHORT CIRCUIT PROTECTION

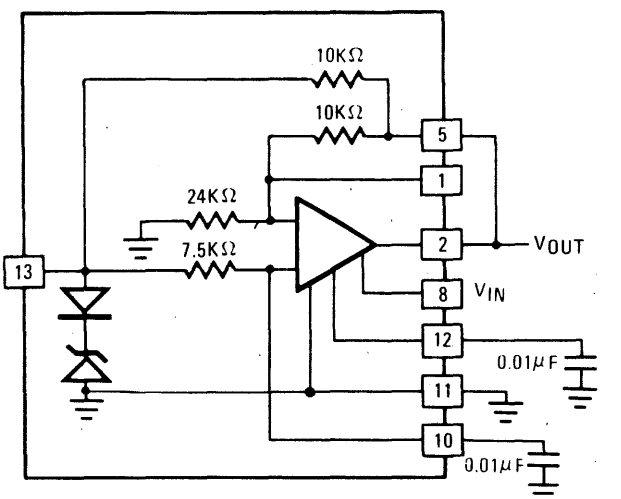
APPLICATIONS

- EXTERNAL VOLTAGE REFERENCE FOR DATA CONVERTERS (D/A OR A/D)
- COMPARATOR REFERENCE
- VOLTAGE REGULATOR REFERENCE



DESCRIPTION

The Harris HA-1610 is a monolithic +10V precision voltage reference packaged in a Hermetic Dual-in-Line package. The voltage output of the HA-1610 is held constant under varying external conditions by a reference zener and buffer amplifier. The feedback resistors and zener bias resistor are laser trimmed to provide the initial accuracy of 10 ± .01% and optimum T_C of ± 5ppm/°C (Max.) over the operating temperature range.



The HA-1610 accepts an unregulated 12V to 30V DC input and provides a accurate +10V DC output at a typical load current of 10mA. For higher current output, an external amplifer may be connected inside the feedback loop as a current booster. The high precision voltage output and low power dissipation (I_Q = 2mA Typ.) characteristics of HA-1610 make it an ideal choice for applications where high precision and high stability is a necessity, such as the voltage reference for 12 bit D/A or A/D converter.

HA-2420/2425

Fast Sample and Hold Gated Operational Amplifier

FEATURES

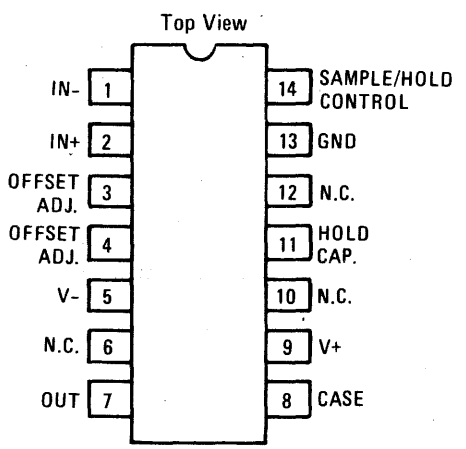
- SAMPLE CURRENT/HOLD RATIO 10^6
- ACQUISITION TIME (0.01%) $5\mu s$
- SLEW RATE $5V/\mu s$
- BANDWIDTH 2MHz
- APERTURE DELAY 50ns
- LOW CHARGE TRANSFER 10pC
- DTL/TTL COMPATIBLE CONTROL INPUT

APPLICATIONS

- A TO D INPUT (TO 13 BITS)
- D TO A DEGLITCHER
- AUTO ZERO SYSTEMS
- PEAK DETECTOR
- GATED OP AMP

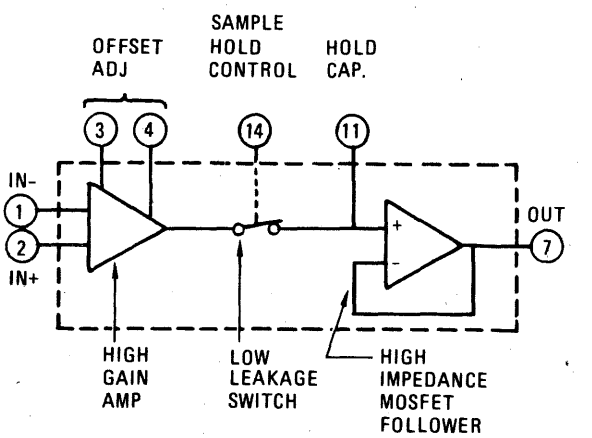
DESCRIPTION

The HA-2420/2425 is a monolithic circuit consisting of a high performance operational amplifier with its output in series with an ultra-low leakage analog switch and a MOSFET input unity gain amplifier.



With an external holding capacitor connected to the switch output, a versatile, high performance sample-and-hold or track-and-hold circuit is formed. When the switch is closed, the device behaves as an operational amplifier, and any of the standard op amp feedback networks may be connected around the device to control gain, frequency response, etc. When the switch is opened the output will remain at its last level.

Performance as a sample-and-hold compares very favorably with other monolithic, hybrid, modular, and discrete circuits. Accuracy to better than 0.01% is achievable over the temperature range. Fast acquisition is coupled with superior droop characteristics, even at high temperatures. High slew rate, wide bandwidth, and low acquisition time produce excellent dynamic characteristics. The ability to operate at gains greater than 1 frequently eliminates the need for external scaling amplifiers.



The device may also be used as a versatile operational amplifier with a gated output for applications such as analog switches, peak holding circuits, etc.

Intech/Function Modules, Inc. is one of the leading suppliers of precision data conversion modules in the world. Since the union of Intech, Inc. and Function Modules, Inc. in 1974, we have been innovators in the field.

Intech/FMI's achievements include:

the first 16 bit, 8μs A/D (A-856);

the first 5½ digit dual slope A/D (109/110);

the first low cost 16 bit DAC (416);

the first 0.025% monolithic V/F (A-8400).

These are but a few of the products at which we at Intech/FMI have become experts. Signal conditioning, analog computation, and data conversion are our speciality.

Intech/FMI is responsive to our customer's needs. We have developed over 500 custom designs to answer specific design problems, both industrial and military. We have participated in such projects as A6E, B-1, F-16, Lance, Patroit, Poseidon, and Trident to name a few.

Our sales offices are located at 282 Brokaw Rd., Santa Clara, Calif. 95050. If you have any questions or specific needs call at (408) 244-0500 or call one of our representatives listed in this compendium. We are here to serve you.

A-8400

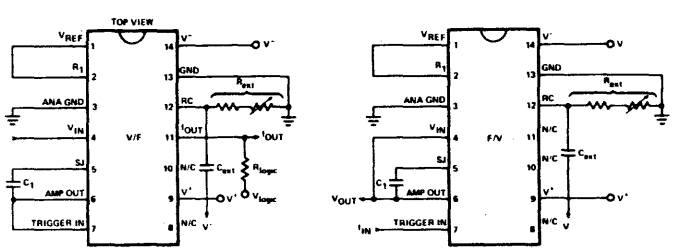
Voltage-to-Frequency-to-Voltage Converter

DESCRIPTION

The A-8400 is a low-cost monolithic voltage-to-frequency converter that provides linear conversion of 0 to +10 V analog signals to a digital pulse train whose repetition rate is proportional to the analog voltage. This converter is designed to provide accurate and reliable performance, with versatile adjustment-free operation at low cost. A wide variety of input voltage scaling and output interfacing can be accomplished to satisfy many data acquisition and signal conditioning applications.

OPERATION

V/F Mode



The analog input forces a current to flow through the input resistor into the integrating capacitor causing the output of the integrator to move in a negative direction. At a given voltage level, the comparator circuit triggers the timing reference network to turn the controlled current source on so that it discharges the integrating capacitor. As the capacitor discharges, the output of the integrator moves in a positive direction. When the timing reference has finished discharging the capacitor, the output of the integrator is positive and ready to start the process again for the next cycle. For current inputs into the summing junction (Pin 5), it is recommended for good temperature stability that an external R_{REF} be used between Pin 1 and $-V_{CC}$.

F/V Mode

As a frequency-to-voltage converter, the A-8400 accepts negative-going TTL pulses into the trigger circuit which starts the one-shot cycle (period=$T=R_{ext}\,C_{ext}$).

The current source forces current out of the summing junction for the one-shot period. The amplifier acts as a current-to-voltage integrator providing a voltage output proportional to the average current (also proportional to the input frequency). F/V linearity will be the same as in the V/F mode. Output ripple is controlled by the integrating capacitor (C_{INT}).

PIN CONNECTION

14 Pin DIP (Ceramic)

SPECIFICATIONS (Typical @ +25°C and ±15V Supplies Unless Otherwise Noted)

A-8402
Single Supply
Voltage-to-Frequency-to-Voltage Converter

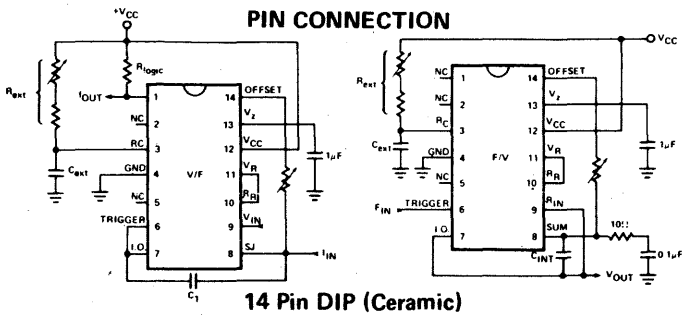
DESCRIPTION

The A-8402 is a low-cost monolithic voltage-to-frequency converter that provides linear conversion of analog signals to a digital pulse train whose repetition rate is proportional to the analog signal.

Key features of the A-8402 V/F/V are its single power supply operation and the ability to be scaled over a 0 to +18V/0 to 100kHz range and virtually achieve 11 bit accuracy with a minimum number of components.

OPERATION

V/F Mode



An improved form of the charge-balancing technique is used in the A-8402. The analog input forces a current to flow through the input resistor into the integrating capacitor causing the output of the integrator to move in a negative direction. At a nominal .7 volt level, the comparator circuit triggers the timing reference network to turn the controlled current source on so that it discharges the integrating capacitor. As the capacitor discharges, the output of the integrator moves in a positive direction. When the timing reference has finished discharging the capacitor, the output of the integrator is positive and ready to start the process again for the next cycle. For current inputs into the summing junction (Pin 8), it is recommended for good temperature stability that an external R_{REF} be used between Pin 11 and ground. It is also recommended that the internal R_{offset}, R_{REF} and the input resistor be used together for good TC performance. T_{OS} influences frequency stability; therefore low TC components should be used.

F/V Mode

As a frequency-to-voltage converter, the A-8402 accepts negative-going TTL-Level pulses into the trigger circuit which starts the one-shot cycle (period=$T_{OS}=R_{ext}\ C_{ext}$).

The current source forces current out of the summing junction for the one-shot period. The amplifier acts as a current-to-voltage integrator providing a voltage output proportional to the average current (also proportional to the input frequency). Output ripple is controlled by the integrating capacitor (C_{INT}). A low pass filter is recommended on Pin 8. Pin 13 may be used for external referencing (maximum current drain $<350\mu A$).

PIN CONNECTION

14 Pin DIP (Ceramic)

NOTES: 1. Applies to V/F & F/V modes. 2. Adjustable to zero error. 3. Of final frequency. 4. Adjustable to other full scale input/output levels. 5. F/V mode–min. V_{OUT}=0.4V. 6. Output level determined by external pull-up resistor. 7. One TTL load unit is –1.6mA at LO (+0.4V) and +40µA at HI (+2.4V). 8. Warm-up time = 5 min.

©IC MASTER 1979

Monolithic Voltage-Frequency Voltage Applications

Since the explosion of μP applications, many designers are looking for inexpensive, reliable multiplexed input sections that can be made compatible to their bussing system. The A-8402 is of particular interest here since it may operate from a single +5v supply and can be operated in a synchronous mode. Further advantages of the following scheme are increased TC performance, typically 25ppm/°C, and direct compatibility to microprocessor use.

Figure 1 details the hook-up of the A-8402. Note that the one shot is no longer a part of the circuit, deleting that portion of the TC error. C ext is deleted and R ext = 27K (this value is not critical). The clock cycle is not critical as long as it triggers the flip-flop.

Figure 2 shows the basic block diagram of an eight channel synchronous, multiplexed V/F system. It should be noted that the external clock frequency is dependent upon the number of input channels desired and is found from the equation:

$$Fce = (N)\ (F_{f.s.}),$$

where Fce = clock frequency

N = number of input channels

F_{fs} = full scale output of the A-8402.

Running many V/F converters synchronously from a single clock allows you to multiplex the outputs via parallel-to-serial transmission medium. After the falling edge of the divide-by-8 clock output, each V/F and its associated flip flop's Q output remain in their HIGH or LOW state until the next falling edge of the clock. At this time the MUX samples each V/F output in succession and transmits it to the demultiplexer, where it is decoded for parallel output. The one-shot clears the demultiplexer on the next falling edge of the clock, and the process repeats. In some cases you may have to strobe the demultiplexer's output into a latch.

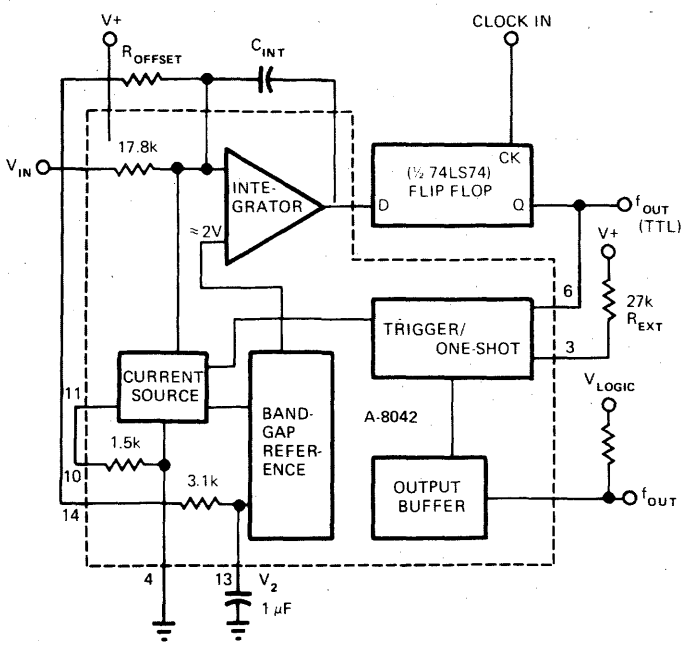

Fig. 1—In this synchronous operating scheme, the output frequency comes from either the A-8402's f_{OUT} pin or the flip flop's Q or $\overline{Q}$ outputs.

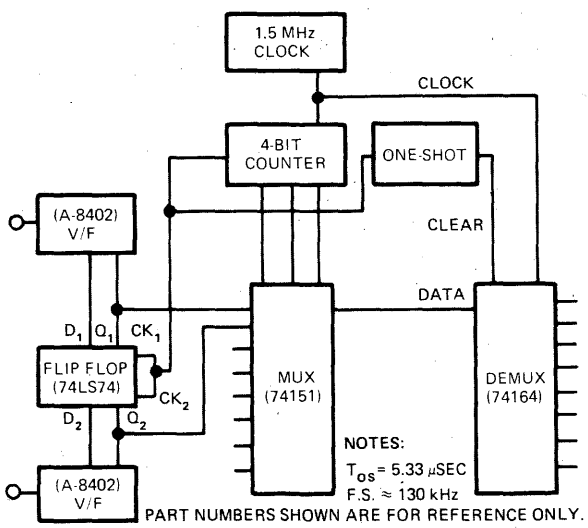

Fig. 2—By synchronizing several V/F's from a single clock, you can design a multiplexed data-transmission system.

MC14406
MC14407

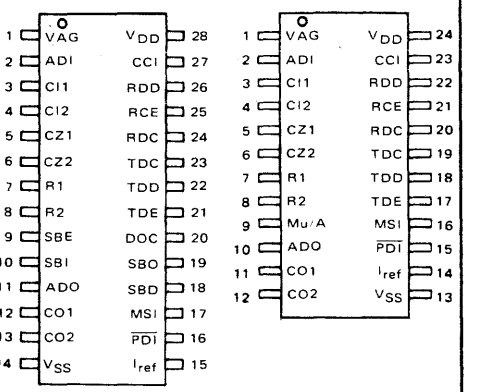
Advanced Information

CMOS LSI

(LOW POWER COMPLEMENTARY MOS)

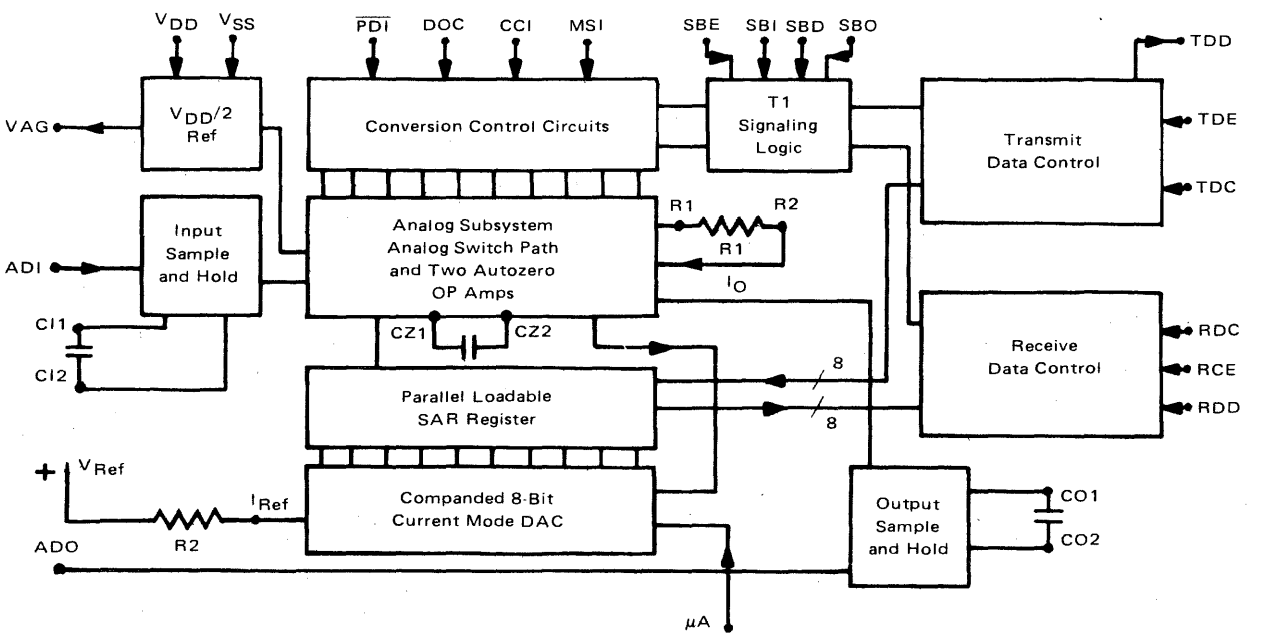
FULL DUPLEX 8-BIT
COMPANDED PCM CODEC

PULSE CODE MODULATION (PCM) CODEC



The MC14406 and MC14407 per channel PCM codecs are designed for 8000-samples-per-second, 8-bit-per-sample voice coding and decoding. These devices are full duplex and provide both Mu and A companding laws.

The transmit and receive data rates are independently selectable from 64 kHz to 3.088 MHz allowing direct interface to 24, 30, 32, and 48 channel digital frames.



Both codecs are fabricated using CMOS technology for reliable low power performance. The MC14406 is the full feature device in a 28-pin package. The MC14407 provides a 24-pin package without signaling capabilites.

- Per Channel Full Duplex Capability
- Low Power Operation – 80 mW Typ
- Power Down Input (1.0 mW Max in Power Down Mode)
- Pin Selection of A-law and Mu-law Companding (MC14407)
- Single Power Supply Operation – 10 to 16 volts
- Zero Code Suppression
- Transmit and Receive Signaling Available (MC14406)
- Independent Transmit and Receive Clocks to 3.088 MHz
- Externally Selectable Full Scale
- On-Chip Auto Zero

VAG – Analog Ground Output (V_{DD}–V_{SS})/2. VAG is the output of the internal (V_{DD}–V_{SS})/2 voltage reference. A pull-up load resistor and bypass capacitor may be required if this output is to be used elsewhere in the system. This pin serves as the analog ground.

ADI – Analog Data Input. The band-limiting input filter between the channel unit hybrid and the codec drive pin 2. Driver source impedance should be 600 Ω or less. This is the voice input to the codec and will be sampled at 8.0 kHz.

CI1, CI2 – Input Sample Capacitor. The input sample capacitor is connected to these pins. A 2000 pF silver mica capacitor is recommended.

CZ1, CZ2 – Auto Zero Capacitor. The auto zero circuit requires a 2000 pF capacitor between these pins.

R1, R2 – Gain Resistor. The V-to-I conversion resistor is connected between these pins. Gain is established by the ratio of this resistor and the resistor at pin I_{ref}.

Mu/A – Mu-Law/A-Law Select (Internal Pull-Up). Selection of Mu-law or A-law coding is provided for logic control. An internal pull-up provides Mu-law output. An external connection to V_{SS} provides A-law operation.

SBE – Signal Bit Enable (Internal Pull-Down). SBE controls the insertion of transmit signaling bits into the transmit data register. When taken high, the next transmit word will contain the SBI pin level in the LSB position rather than the last bit of the PCM word. If kept high, the SBI data will be inserted in succeeding conversions until one conversion after it is brought low. It can be used for on-hook signaling or A and B signaling in D3 banks.

SBI – Signal Bit Input (Internal Pull-Down). SBI is the data input for transmitting signaling bits. The level of SBI will be latched on the leading edge of SBE, or by the internal latch data pulse if SBE is held high. If SBE is pulsed, the leading edge of SBE will latch SBI, and load it into the next transmit word.

ADO – Analog Data Output. ADO outputs the received PAM sample for three convert clock cycles beginning with MSI. It then returns to the output neutral voltage which may be a few millivolts different from VAG1.

CO1, CO2 – Output Sample Capacitor. The output sample capacitor is connected between these pins. A silver mica capacitor of 2000 pF is recommended.

V_{SS} – Most Negative Supply. This is the most negative supply pin, and the digital ground. All digital inputs and outputs will swing the full supply voltage.

I_{ref} – Current Reference Input. A reference current of 50 to 200 μA sets the full scale DAC current. An 80 μA input current corresponds to 1.28 mA full scale DAC current at pin R2.

$\overline{PDI}$ – Power-Down Input. $\overline{PDI}$ deactivates the codec when pulsed to V_{SS}. In the power-down mode the analog circuitry bias is turned off and the digital clock inputs are disabled. Power-down dissipation is less than 1.0 mW.

MSI – Master Sync Input (Internal Pull-Down). The MSI leading edge resets the entire chip to the initial cycle (0000). The chip continues operation on the next leading edge of data and convert clock. MSI also resets the output data multiplexer to the transmit word sign bit.

SBO – Signal Bit Output. SBO outputs the LSB of the receive data register. The LSB may be sampled externally during the first three convert clocks after MSI or used as a trigger pulse in off-hook applications.

©IC MASTER 1979

SBD — Signal Bit Decode (Internal Pull-Up). Signal bit decode allows the control of the 1/2 LSB or LSB centering required in sample decode cycles. It is loaded by the RCE edge in each cycle. If a zero is entered, the next decode cycle adds 1/2 LSB to the 8-bit received word to center the quantization error of the 8-bit received sample when the output sample capacitor is charged. If a 1 is loaded by RCE, the 1/2 LSB is not added, and the LSB is forced to a 1 to form a centered error 7-bit output, and the LSB is ignored and assumed to be signaling information. (For codes 1111111X or 0111111X, the LSB is disabled for SBD high.)

DOC — Decode Only Control (Internal Pull-Down). DOC is normally tied low. When high, it configures the device to skip the eight convert clocks used for A-to-D conversion. The operating cycle is then two clocks for PAM output at ADO and six clocks for charging the next output sample. The device may be used to do as many as four decode cycles in a 125 μs/period with an external transmission gate selector.

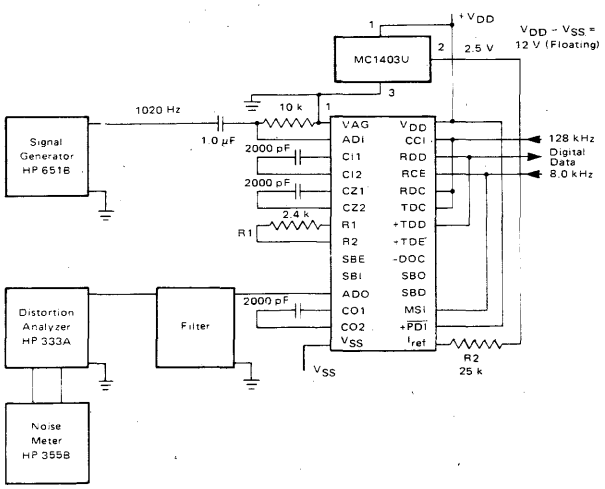
Received Data is loaded into the transmit data register at MSI when in DOC mode, so DOC can be used as a digital loop back control.

TDE — Transmit Data Enable (Internal Pull-Up). The Transmit Data Enable is a three-state control for the transmit digital output. A number of codec outputs can be interleaved into a serial stream by connecting the outputs and controlling TDE with a 1-of-N decoder. It will provide switching characteristics capable of 3.088 MHz operation.

TDD — Transmit Digital Data. The Transmit Digital Data rate is controlled by the data clock input, and is frame aligned with the Master Sync Input. If data clock is at 1.544 MHz, and convert clock is at 128 kHz, the new sign bit will be output beginning with the leading edge of convert clock 8, and the 8-bit word repeated throughout the convert cycle at the data clock rate. The data word is inverted offset binary with zero code suppression. See Conversion and Data Timing.

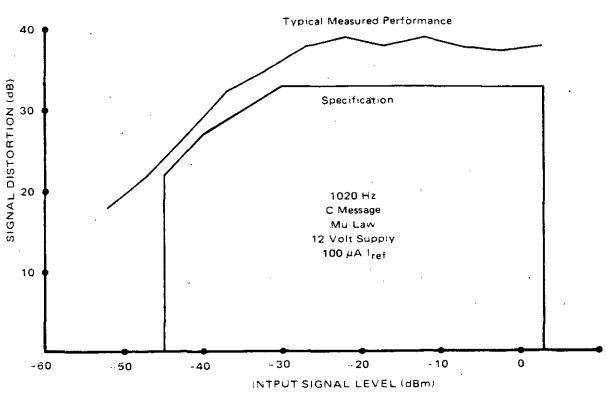
TDC — Transmit Data Clock. TDC sets the digital data rate of the codec. The transmit data stream will provide a continuous repetition of the current transmit data word at the TDC bit rate, beginning with MSB first and synchronized with the last MSI. The new data word is loaded and serially output at mid-cycle or on the leading edge of convert clock 8.

RDC — Receive Data Clock. RDC controls the receive data register. It clocks the receive-data register on the trailing edge under the control RCE. It is often connected to TDC.



RCE — Receive Clock Enable. The rising edge of RCE triggers the receive data register to accept a new data input. After the rising edge of RCE, the data on RDD is loaded into the Receive Data Register on the next eight trailing edges of RDC. The ninth clock transfers the new 8-bit word to an internal intermediate register and frees the Receive Data Register for a new RCE.

RDD — Receive Digital Data. RDD is the input to the receive data shift register. It is controlled by RCE. The register is clocked on the trailing edge of RDC. The data format is sign bit first, inverted offset binary code.



CCI — Convert Clock Input. CCI controls the conversion sequence. A 128 kHz clock will produce 64K-bits/s full duplex operation and a 256K-bits/s clock will produce 64K-bit operation for two channels. Sixteen clocks represent one chip cycle from MSI to MSI.

V_{DD} — Most Positive Supply. V_{DD} is typicallv 12 V with an operation range of 10 V to 16 V. All logic outputs swing the full supply voltage.

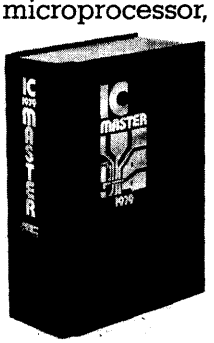
"I need to know if this device exists, and if there are any alternate sources. Where do I start?"

- Memory IC
- RAM
- Static
- 1024x1
- CMOS
- 250 Nanoseconds
- 5 Volts

If you're spending hours to solve a problem similar to the one above, you're behind the times...



It only takes a few seconds with "THE MASTER."

Clear your desk for action with the newly revised 1979 IC Master. Its all-under-one-cover features include: Over 40,000 standard products from more than 87 different companies... five different selection guides (memory, microprocessor, interface, linear and digital.) ... alternate source directory for pin- for- pin, function- for- function replacements ... applications directory... complete military section ... a complete part numbering guide ... etc.

You don't have to search through stacks of catalogs. Simply look up the specs and function you need. You don't need a part number to start with.

All you need is a problem to use The Master. Does the device exist? Who makes it? Is there an alternate source? What's the part number? Is there an applications note? Who is my closest distributor—etc.

The BI-FET Process

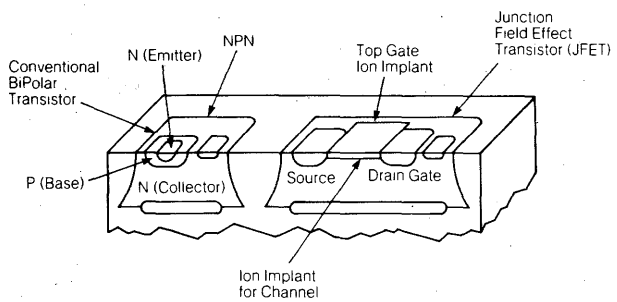
What's New about BI-FETs?

The desire for a monolithic FET, to incorporate in linear circuit design, has been around for many years. In fact, many unsuccessful attempts were made using standard bipolar base and emitter diffusions. The major problem with this approach is the inability to control the all important pinch-off voltage, which is proportional to the concentration of the dopant in the channel.



The key to the BI-FET process, which National pioneered six years ago, is the use of ion implantation of the channel and gate regions. By implanting the channel, very precise control of the channel dopant is achieved, and therefore the pinch-off voltage is maintained uniform in volume production. This breakthrough in semiconductor technology allowed the first BI-FET op amp family to be introduced in 1975.

BI-FET II

In addition to mastering the ion implant technology, National Semiconductor uses special processing techniques to reduce the input offset voltage, reduce the noise, and enhance the speed capabilities. One such process, which is now in full production, is the use of laser trimming of resistors at the input stage to reduce the input offset voltage down to 2.0 mV or less. This is BI-FET II.

Presently, at National, there are several new processing investigations which promise that the performance of future BI-FETs from National will be even more startling than the present devices. And it goes without saying, the development of these new techniques will be consistent with high volume production, resulting in another important feature—low cost to the user.

Ultra-matched JFETs and BiPolar Transistors

The BI-FET Process

Advantages to Designers

Why use BI-FET and BI-FET II?

The chart below points out the major features of BI-FET op amps and advantages offered to designers:

Performance Features	Advantages to Designers
Low input bias current	Minimum current loss into amplifier inputs from feedback network or input signal source.
Low input offset current	Reduces concern for matching impedances on each amplifier input.
High input impedance	Allows use of high impedances for input and feedback networks and driving sources.
Low V_{os} options	Minimizes dc output errors in high gain configurations and can eliminate need for offset adjustments.
Low input noise voltage and current	Allows amplification of very small signals.
Internal compensation	Reduces component count by not requiring an external capacitor for stable, trouble free operation.
Wide bandwidth	Permits more gain at higher frequencies and reduces square wave rise times.
High slew rate	Allows large sinusoidal output voltage swings (±10V) at high frequencies (200 kHz) without slew distortion.
Low distortion	Low input stage gm and class AB output stage yield negligible distortion.
Fast settling time	Increases sampling rate in data acquisition system.
Ability to drive C loads	The amplifier can drive capacitors (filters, sample and holds) or relatively long lengths of cable without stability problems or ringing.
Short circuit protection	Will survive an output short indefinitely
Static discharge blowout proof	No special handling considerations necessary. JFETs are rugged, unlike CMOS.
Insensitive to RFI	Allows normal operation in RF systems and eliminates audio rectification problems.
Pin-for-pin compatibility	With all popular devices.
Low cost	One advantage every designer wants.

©IC MASTER 1979

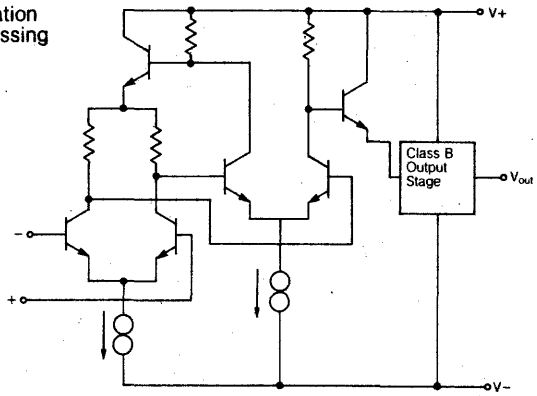
Advantages of the BI-FET Process

The BI-FET process which combines bipolar transistors and junction FET's brings many advantages to design engineers. The most obvious advantage is the low input currents and corresponding high input impedance. In addition it can be shown that for an input stage running at the same current, a JFET input stage will be 20 times faster than the equivalent bipolar stage. Thus larger bandwidths and slew rates are obtained using JFET's.

Also, because a JFET does not have a "forward biased" junction as does a normal transistor, the JFET input stage is immune to rectification of spurious RFI which hampers some Bipolar small signal amplifier designs which must operate in an RFI environment.

In addition to the excellent input stage, National's LF355, LF356 and LF357 series use a JFET output stage. By eliminating the PNP transistor at the output, excellent settling time, low AC output impedance at high frequencies, and the ability to drive large capacitive loads results.

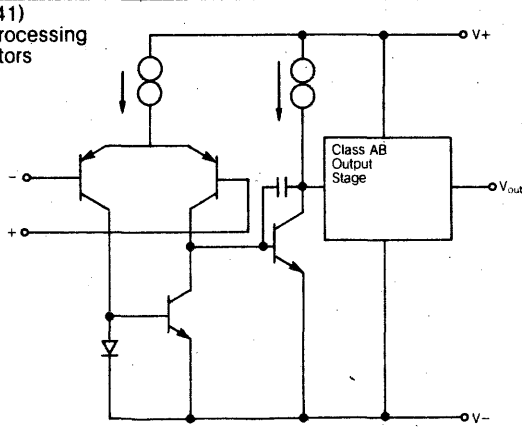
BI-FET II, the laser trimmed BI-FET op amp, attacks the other enemy of the circuit designers—offset voltage. Using laser trimming at the JFET input stage, offset voltage can be reduced to less than 2.0 mV, a remarkable achievement for a FET input amplifier.



These features all combine to make BI-FET the future for all circuit designers using operational amplifiers.

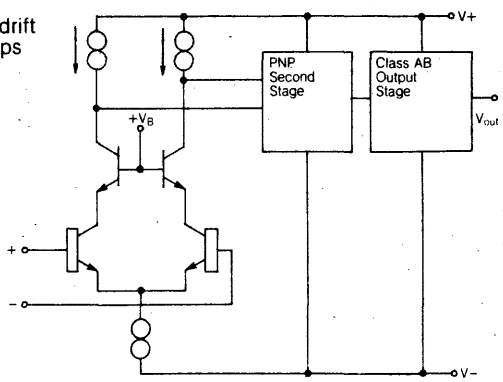
Evolution of the Monolithic OP AMP

Innovations by National Semiconductor— The Linear Leader



The Original—LM709

- ☐ First monolithic IC to be mass produced
- ☐ Required external compensation
- ☐ Used standard bipolar processing

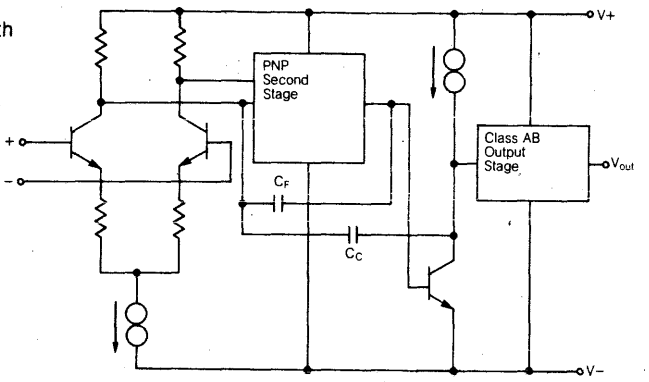


An Improvement—LM101 and LM741

- ☐ Internally compensated (LM741)
- ☐ Improved circuit design and processing
- ☐ First use of lateral PNP transistors

Super Beta—LM108 and 108A

- ☐ Innovative processing—first super beta transistors
- ☐ First to guarantee offset voltage drift
- ☐ Lowered bias current to nanoamps

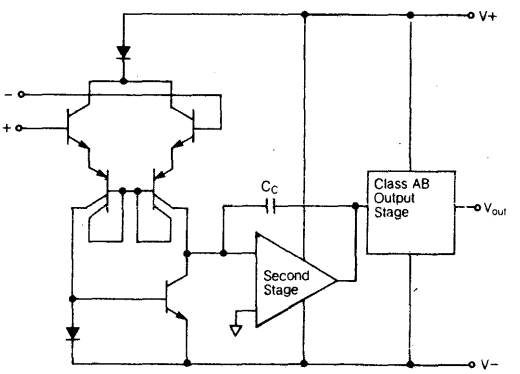


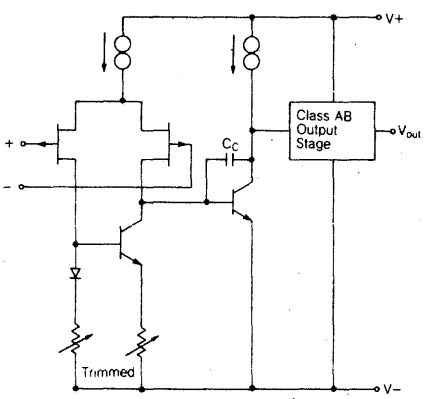
©IC MASTER 1979

Evolution of the Monolithic OP AMP

Wide Bandwidth—LM118

- ☐ First use of feedforward capacitors in a monolithic IC to improve speed
- ☐ High slew rate
- ☐ Wide bandwidth

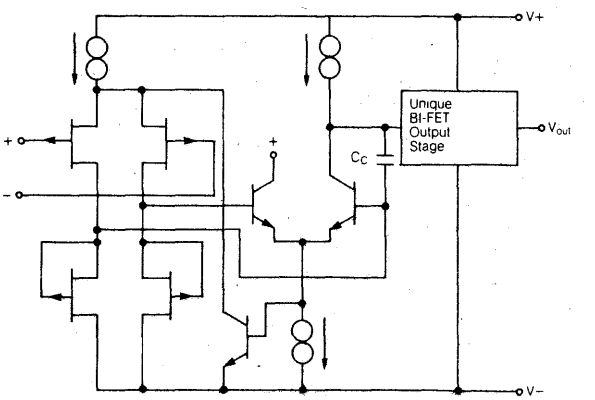




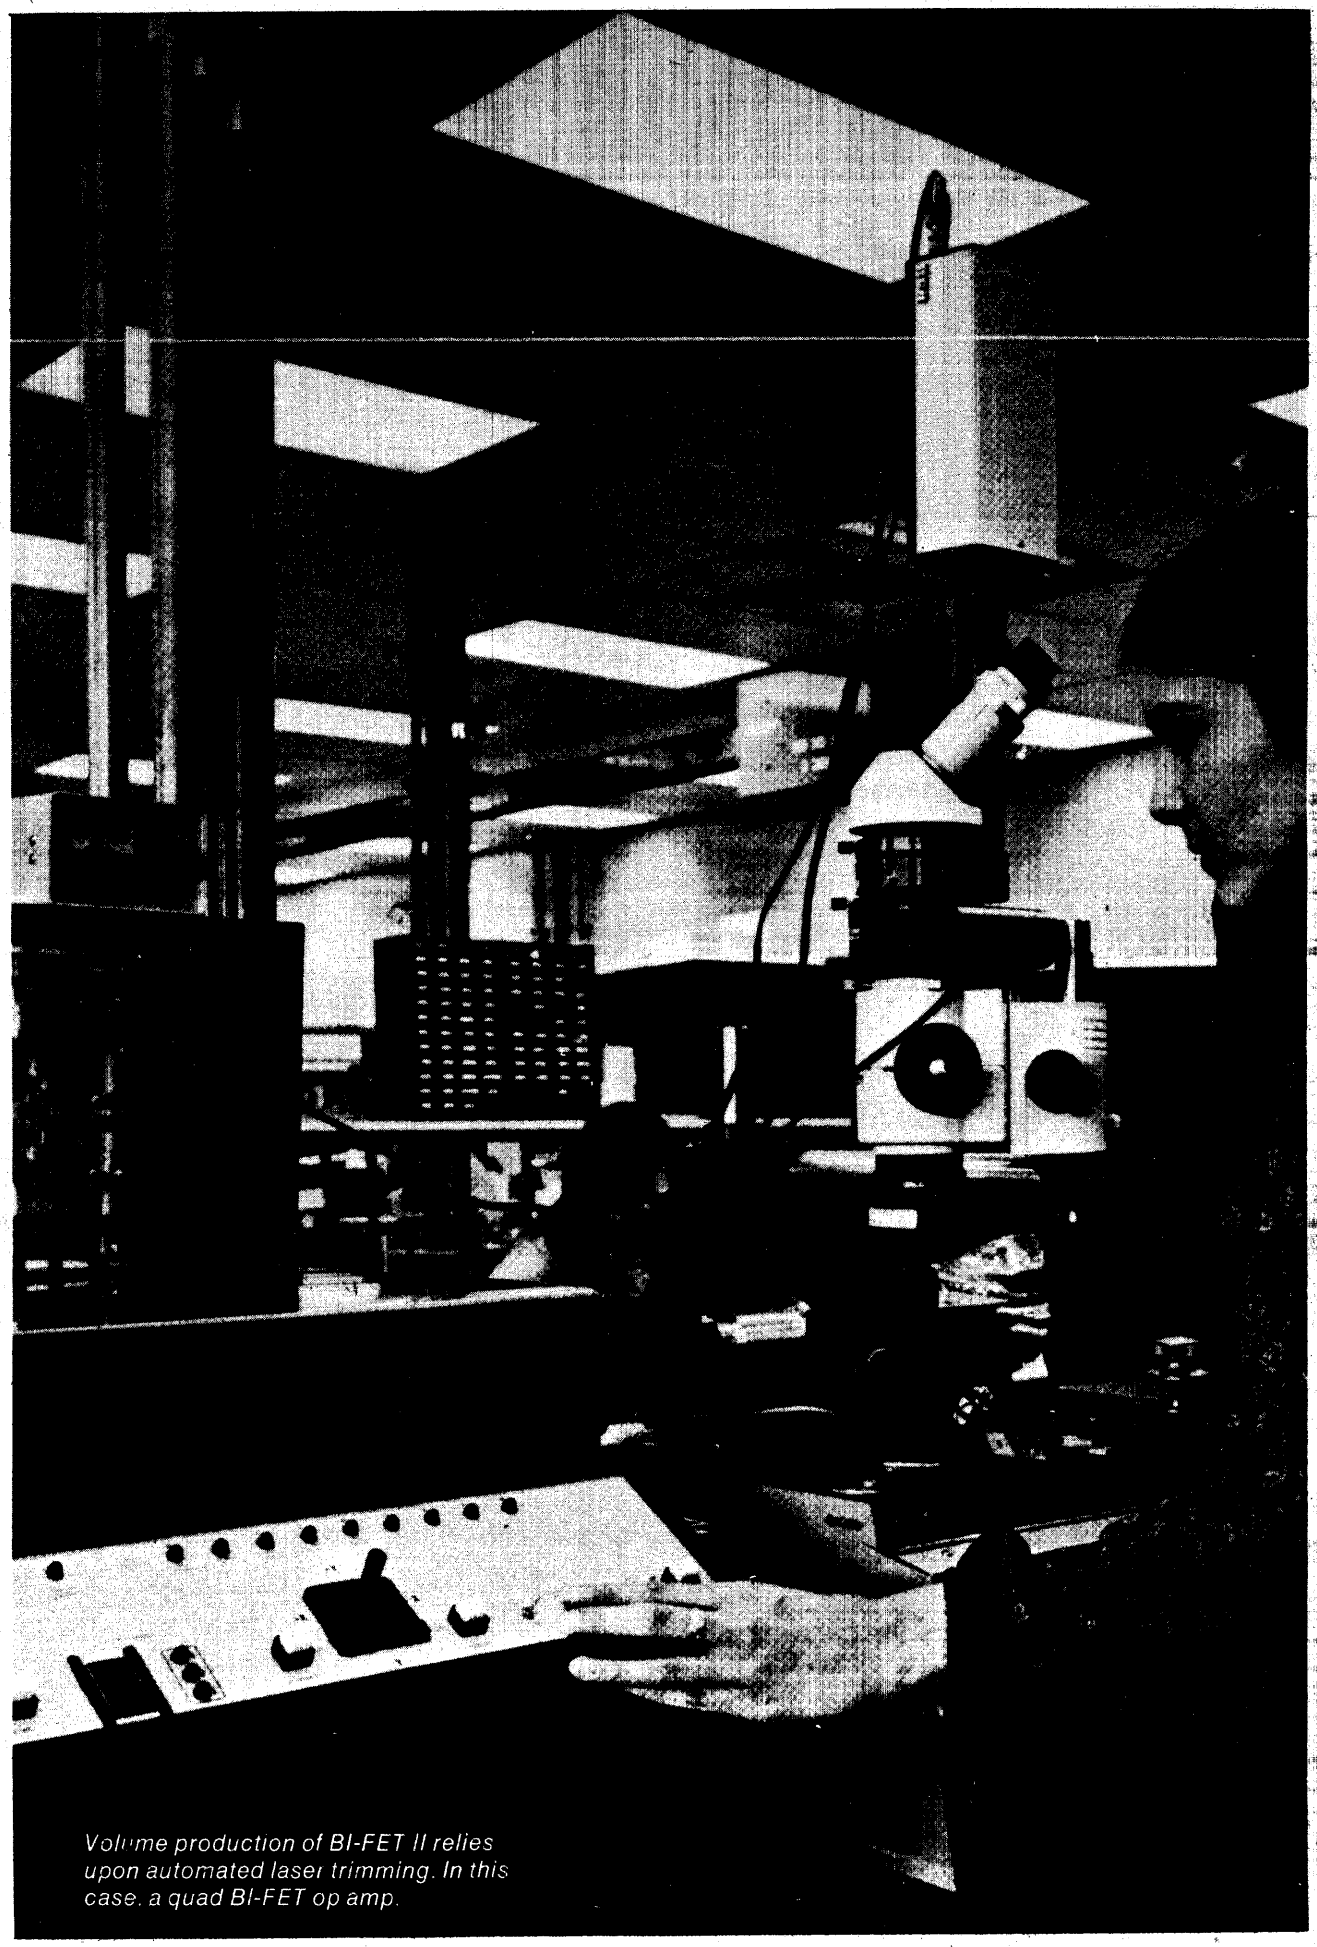
BI-FET II—Laser trimmed BI-FET op amps: LF351, LF353, LF347

- ☐ Complete family of singles, duals, and quads
- ☐ Small IC dies resulting in low cost
- ☐ Compatible pin-outs with existing duals and quads
- ☐ JFET inputs for withstanding input transients
- ☐ Laser trimming to obtain low offset voltage
- ☐ Fast slew rate
- ☐ Wide bandwidth and wide full power bandwidth
- ☐ Internal compensation
- ☐ Excellent RFI rejection
- ☐ Rugged handling capability
- ☐ Excellent noise voltage and noise current

Linear LSI—LM124, LM3900, LM148, LM146

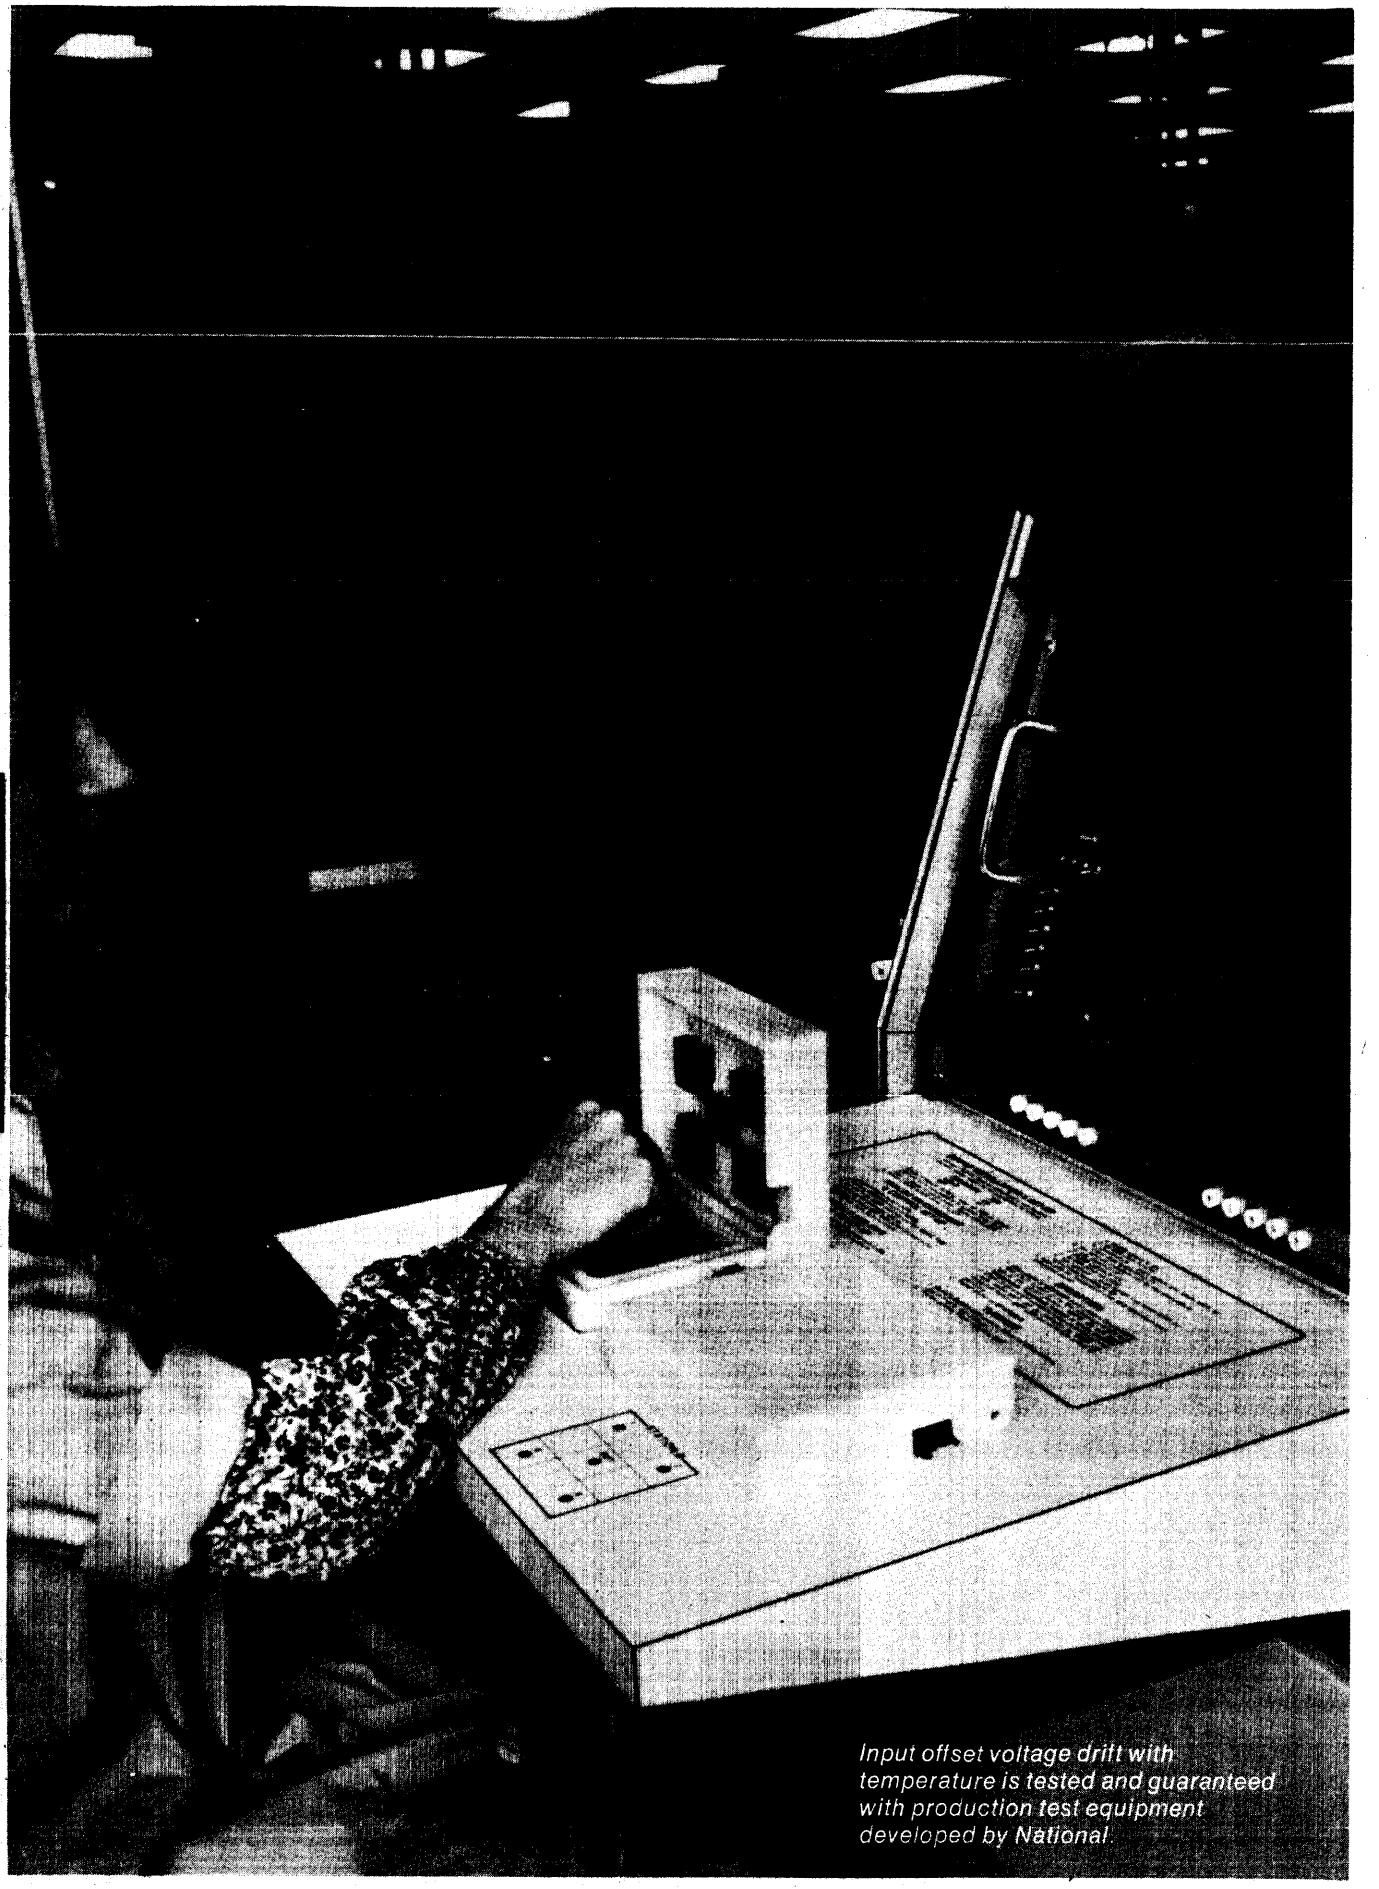


- ☐ First small die size cell enabling low cost dual and quad op amps to be manufactured
- ☐ Excellent general purpose perormance
- ☐ Performance programming capability (LM146)
- ☐ LM148 Amplifier cell shown



BI-FET—LF155, LF156, LF157

- ☐ First designs to combine bipolar transistors with high voltage junction FETs
- ☐ Innovation in processing and circuit design resulting in industry's lowest bias current, highest slew rates, highest capacitive load, drive capability and low cost for monolithic ICs.
- ☐ Very low noise voltage and current.



©IC MASTER 1979

Volume production of BI-FET II relies upon automated laser trimming. In this case, a quad BI-FET op amp.

©IC MASTER 1979

Input offset voltage dritt with temperature is tested and guaranteed with production test equipment developed by National.

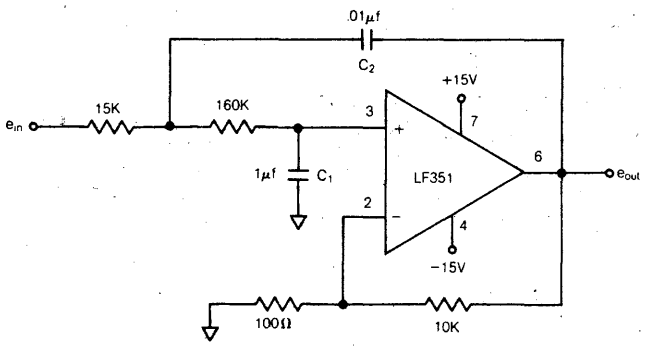
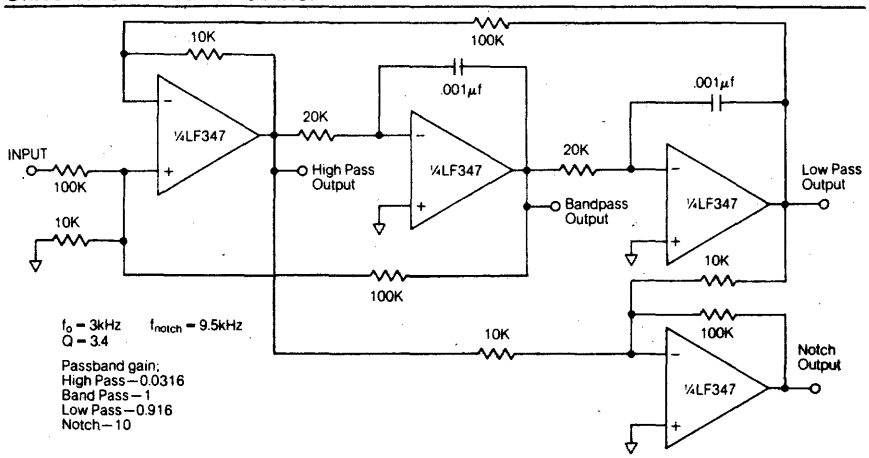
Active Filters

National's high performance BI-FET op amps allow engineers to design RC active filters with fewer limitations on component selection. Some key performance features of interest to active filter designers are:



- ☐ BI-FET op amps, being very close to "ideal," allow the filter designer the ease of using less cumbersome filter design equations that rely upon the "ideal"op amp.
- ☐ The high input impedance and extremely low input bias current attendent with BI-FET permits the use of high value resistors, and consequently, low value capacitors. The use of low value capacitors is attractive due to their smaller size, lower cost, ease of availability, and precision.
- ☐ The low offset voltage, particularly with the BI-FET II series, and negligible offset current on all the National BI-FET devices, make them ideal for DC coupled filters such as lowpass sections.
- ☐ Low noise. Always a plus in any design, but particularly in bandpass and lowpass filter designs to maintain a high signal to noise ratio.
- ☐ Wide gain bandwidth product. This not only simplifies the filter design by allowing the designer to assume the "ideal" op amp case, but further extends the upper fxQ (frequency-Q product) previously obtainable. In any filter design, the fxQ product of any pole or zero should be less than five percent of the gain-bandwidth product of the op amp to assure a predictable filter response. The higher the gain-bandwidth product, the easier the design becomes.
- ☐ High slew rate. Not only does this feature allow for large sinusoidal output swings (±10 V) without slew limitations (distortion) up to 200 kHz, but it also relieves the problems associated with high Q sections and interstage connection where the signal swings may be large. This is particularly helpful when designing high Q notch or bandpass filters.
- ☐ Duals and Quad op amps. A real pc board space and money saver for multi-stage networks.

Single Amplifier Non-Inverting Bandpass



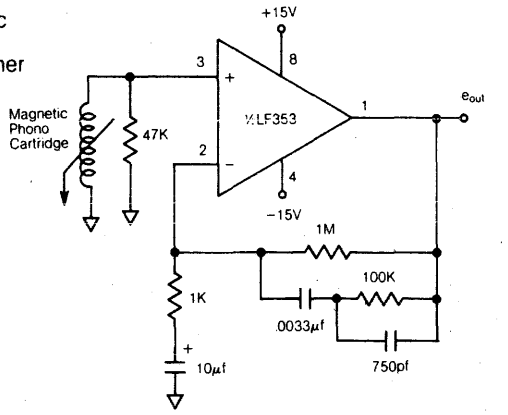
f_o = 20kHz, Q = 10, Av = +1

Single Amplifier High Gain-Lowpass

f_c = 10Hz, Q = .707 (maximally flat response)
Av = +100

Universal State Variable Filter

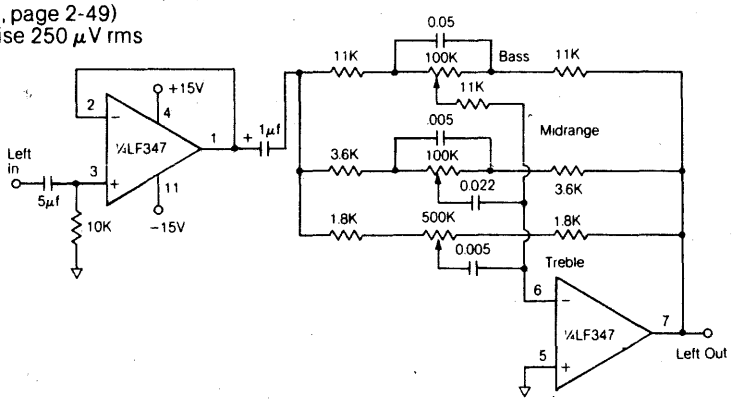
Specific Audio Applications



Audio

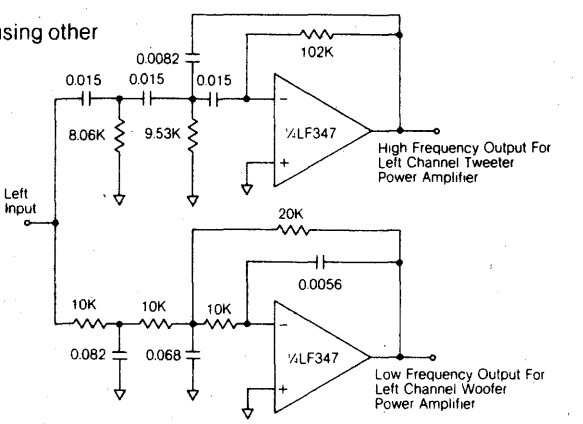
Audio systems require a frequency response bandwidth from 20Hz to 20kHz. All National BI-FET op amps possess the dynamic AC characteristics to provide both versatility and excellent performance over this frequency range. Some of the audio performance highlights are listed below:

- ☐ Wide bandwidth allows a closed loop gain of up to 200 for flat response over a 20kHz bandwidth
- ☐ No slew rate limitation problems.
- ☐ Low harmonic distortion as a result of a low gm input stage and class AB output stage.
- ☐ Low voltage and current noise provide quality sound reproduction.
- ☐ Ability to drive large capacitive loads—the LF356 can drive up to 0.01 μF without problems, making it an ideal amplifier for driving long cables.
- ☐ The input stage, being insensitive to RFI, eliminates the audio rectification dilemmas so often found when a pre amp detects and amplifies local radio signals.
- ☐ The high power supply ripple rejection and input common mode rejection eliminate hum problems.
- ☐ The availability of dual and quad devices simplifies stereo and four channel system designs.



RIAA Equalization Preamp

- ☐ THD 0.05% from 20 Hz to 20 kHz
- ☐ Output noise voltage 220 μV rms (dc to 20 kHz)
- ☐ Duplicate for other channel using other half of LF353



Three Band Tone Control

- ☐ Duplicate for right channel using other two amplifiers of the LF347
- ☐ Circuit performance curve (Audio Handbook, page 2-49)
- ☐ Output noise 250 μV rms

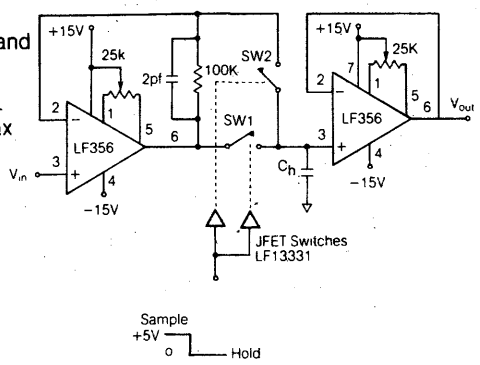
3rd Order Active Crossover Network

- ☐ Crossover frequency 500Hz
- ☐ Passband gain unity
- ☐ Duplicate for right channel using other half of the LF347

©IC MASTER 1979

Specific Data Acquisition Applications

Fast Sample and Hold



☐ Acquisition time (T_A) =

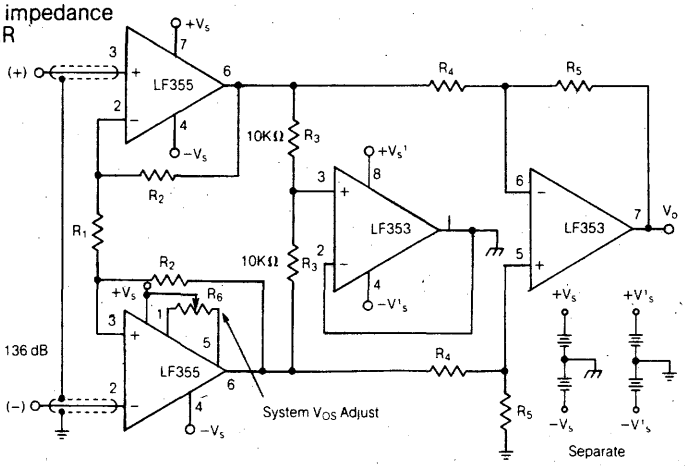
$$\left[\frac{2\,R_{on}\,V_{in}\,C_h}{S_r}\right]^{1/2}$$

where R_{on} is on resistance of SW 1 and S_r is slew rate provided that:

$$V_{in} < 2\,R_{on}\,C_h\,S_r \text{ and } T_A = \frac{V_{in}\,C_h}{I_{out}\,max}$$

if not: $T_A = \frac{V_{in}\,C_h}{20\ mA}$

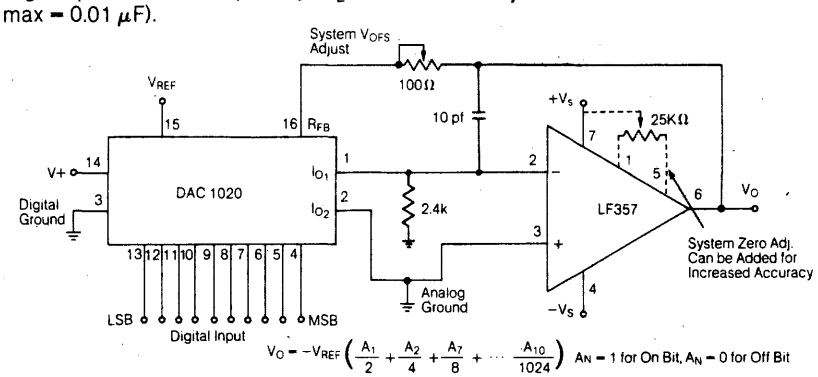
Improved CMRR Instrumentation Amplifier



☐ Very high input impedance
☐ Very High CMRR

$A_V = \left(\frac{2R_2}{R_2} + 1\right)\frac{R_5}{R_4}$

And ⏚ Are Separate Isolated Grounds



Matching of R_2s, R_4s and R_5s Control CMRR

With Av = 1400, Resistor Matching = .01%: CMRR = 136 dB

LF356 as Output Amplifier in D/A Systems

☐ Minimizes system errors due to bias current.
☐ Fast settling output.
☐ High capacitive drive capability (C_L max = 0.01 μF).

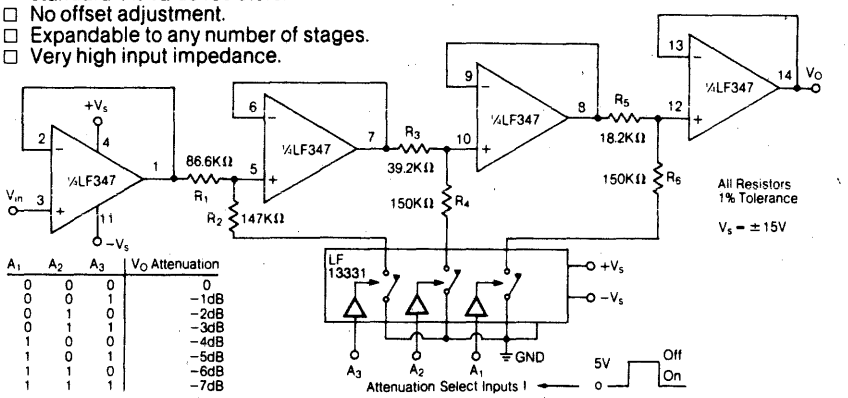
Data Acquisition

Operational amplifiers can perform well in a multitude of functions in data converters and complete data acquisition systems. In any of these systems, minimum error contribution by the amplifier is of maximum concern. National's line of BI-FET devices offers amplifiers suitable for use in high accuracy systems.

☐ Low input bias and offset currents useful in system output amplifiers or current-to-voltage converters for current mode DACs. Also ideal for sample and hold amplifiers used in data acquisition systems.
☐ Fast settling time where minimum conversion time is of prime importance.
☐ High common mode rejection for instrumentation amplifiers.
☐ High input impedance makes impedance translation easy.
☐ Low noise for signal conditioning.

©IC MASTER 1979

Specific Applications

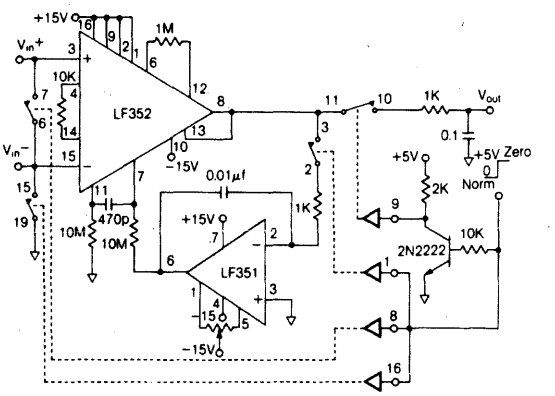


Instrumentation Circuits

Instrumentation circuits demand operational amplifiers with excellent characteristics in all areas of performance. Some of the major features of National's BI-FET line that apply to instrumentation needs are:

- ☐ High open loop gain combined with low noise at low frequencies results in high gain amplifiers with good signal-to-noise characteristics essential to all sensitive instrumentation applications.
- ☐ Low bias current. The requirement for precision long time integrators, logarithmic converters, and multipliers is easily satisfied with National BI-FETs.
- ☐ Wide bandwidth and fast slew rate op amps are needed to accurately amplify fast varying input signals.
- ☐ The high input impedance, large common mode range and power supply rejection inherent in National BI-FET op amps are especially useful for transducer amplifiers.
- ☐ Most instrumentation systems require more than one amplifier. This need is satisfied by National's complete line of single, dual and quad BI-FET op amps, covering all combinations of input offset voltage, bandwidth, low power, and more. A glance at the BI-FET selection guide will quickly find the correct device for your design.

Precision attenuator with attenuation digitally selected

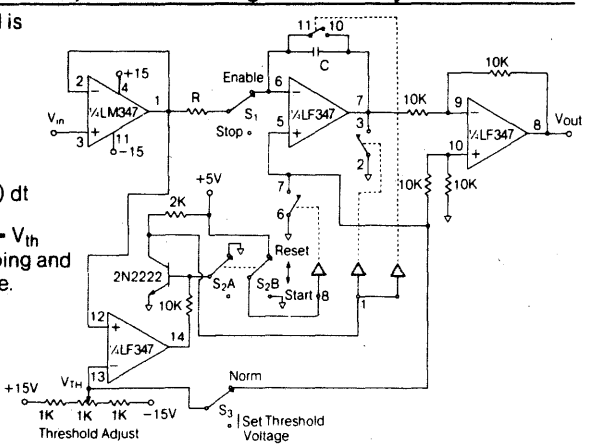


- ☐ Accuracy of better than 0.4% with standard 1% value resistors.
- ☐ No offset adjustment.
- ☐ Expandable to any number of stages.
- ☐ Very high input impedance.

A1	A2	A3	Vo Attenuation
0	0	0	0
0	0	1	-1dB
0	1	0	-2dB
0	1	1	-3dB
1	0	0	-4dB
1	0	1	-5dB
1	1	0	-6dB
1	1	1	-7dB

Auto Zeroed Instrumentation Amplifier

(Allow 500 μs for system to completely zero)

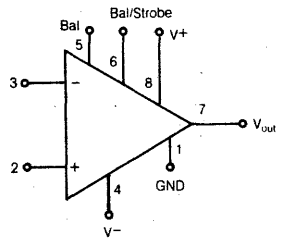


Long Time Integrator with Reset, Hold and Starting Threshold Adjustment

- ☐ V_{out} starts from zero and is equal to the integral of the input voltage with respect to the threshold voltage:

$$V_{out} = \frac{1}{RC}\int_0^t (V_{in} - V_{th})\,dt$$

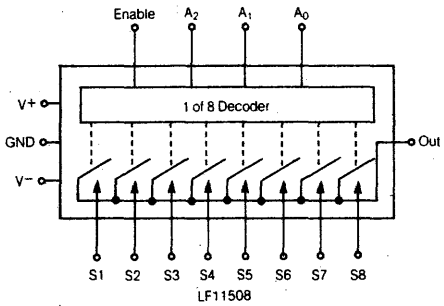
- ☐ Output starts when $V_{in} = V_{th}$
- ☐ Switch S_1 permits stopping and holding any output value.
- ☐ Switch S_2 resets the system to zero.



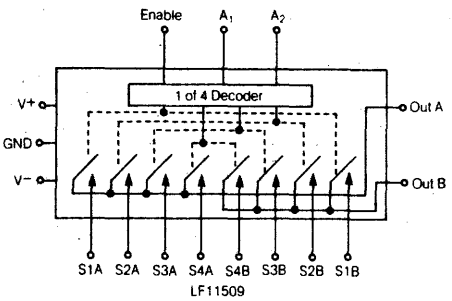
©IC MASTER 1979

BI-FET means more than Op Amps

In addition to op amps, here are other IC's built with this unique process:



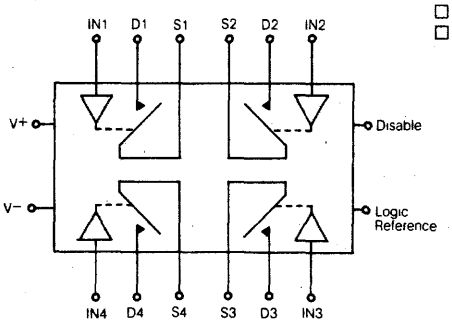
LF111 BI-FET input comparator



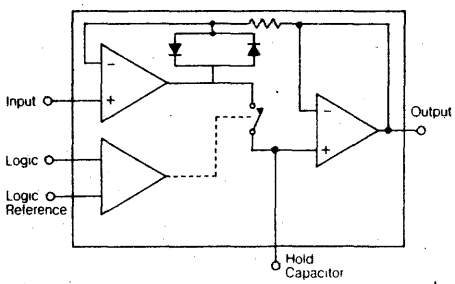
- ☐ Low bias current.
- ☐ High input impedance.

LF11508 and LF11509 8 Channel Single or Differential Multiplexers

- ☐ Low cost.
- ☐ Eliminate CMOS latch-up problem.

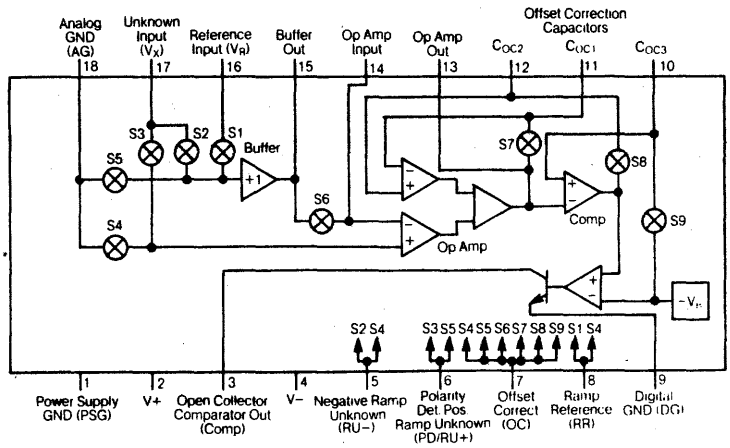


LF11331, LF11332, LF11333, LF11201, LF11202, QUAD SPST Analog Switches



LF11331—4 normally open switches with disable.
LF11332—4 normally closed switches with disable.
LF11332—2 normally open and 2 normally closed switches with disable.
LF11201—4 normally closed switches.
LF11202—4 normally open switches.

- ☐ Low cost.
- ☐ Eliminate CMOS latch-up problems.



LF198 Sample and Hold Circuit

- ☐ First monolithic sample and hold.

LF13300 Dual Slope Integration A/D Analog Building Block

- ☐ Low cost 12-bit A/D and 4½ digit DVM.

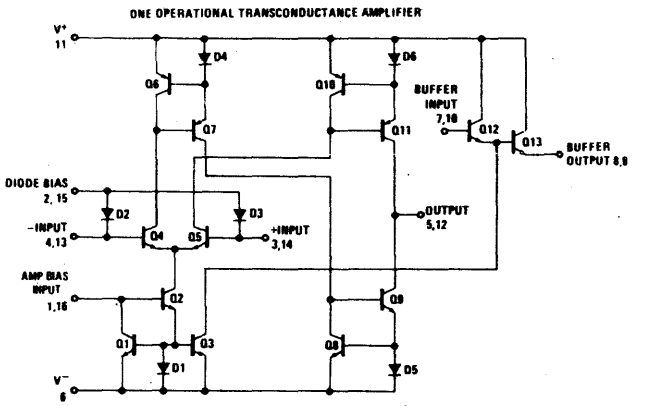
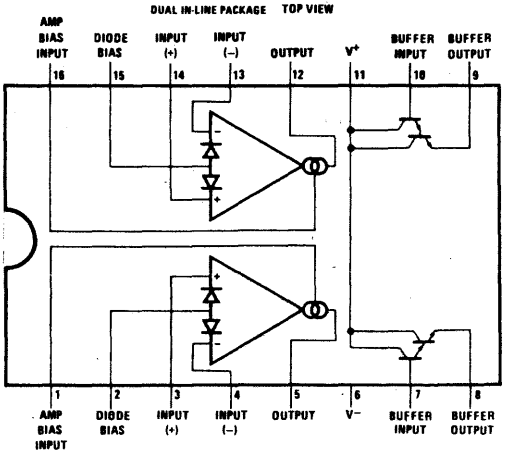
LM13600/LM13600A/LM11600A Dual Operational Transconductance Amplifiers With Linearizing Diodes and Buffers

General Description

The LM13600 series consists of two current controlled transconductance amplifiers each with differential inputs and a push pull output. The two amplifiers share common supplies but otherwise operate independently. Linearizing diodes are provided at the inputs to reduce distortion and allow higher input levels. The results is a 10 dB signal-to-noise improvement referenced to 0.5 percent THD. Controlled impedance buffers are provided which are especially designed to complement the dynamic range of the amplifiers.



Features



- gm adjustable over 6 decades
- Excellent gm linearity
- Excellent matching between amplifiers
- Linearizing diodes
- Controlled impedence buffers
- High output signal to noise ratio
- Wide supply range ± 2V to ± 22V.

Applications

- Current controlled amplifiers
- Current controlled impedances
- Current controlled filters
- Current controlled oscillators
- Multiplexers
- Timers
- Sample and hold circuits

LM192/LM292/LM392, LM2924 Low Power Operational Amplifier/Voltage Comparator

General Description

The LM192 series consists of 2 independent building block circuits. One is a high gain, internally frequency compensated operational amplifier, and the other is a precision voltage comparator. Both the operational amplifier and the voltage comparator have been specifically designed to operate from a single power supply over a wide range of voltages. Both circuits have input stages which will common-mode input down to ground when operating from a single power supply. Operation from split power supplies is also possible and the low power supply current is independent of the magnitude of the supply voltage.

Application areas include transducer amplifier with pulse shaper, DC gain block with level detector, VCO, as well as all conventional operational amplifier or voltage comparator circuits. Both circuits can be operated directly from the standard 5 V_{DC} power supply voltage used in digital systems, and the output of the comparator will interface directly with either TTL or CMOS logic. In addition, the low power drain makes the LM192 extremely useful in the design of portable equipment.

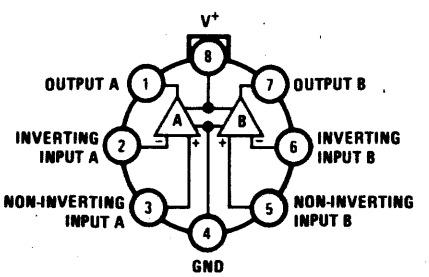
Advantages

- Eliminates need for dual power supplies
- An internally compensated op amp and a precision comparator in the same package
- Allows sensing at or near ground
- Power drain suitable for battery operation
- Pin-out is the same as both the LM158 dual op amp and the LM193 dual comparator

Features

- Wide power supply voltage range
  - Single supply 3V to 32V
  - Dual supply ±1.5V to ±16V
- Low supply current drain—essentially independent of supply voltage 600 μA
- Low input biasing current 50 nA
- Low input offset voltage 2 mV
- Low input offset current 5 nA
- Input common-mode voltage range includes ground
- Differential input voltage range equal to the power supply voltage

ADDITIONAL OP AMP FEATURES



- Internally frequency compensated for unity gain
- Large DC voltage gain 100 dB
- Wide bandwidth (unity gain) 1 MHz
- Large output voltage swing 0V to $V^+ - 1.5V$

ADDITIONAL COMPARATOR FEATURES

- Low output saturation voltage 250 mV at 6 mA
- Output voltage compatible with all types of logic systems

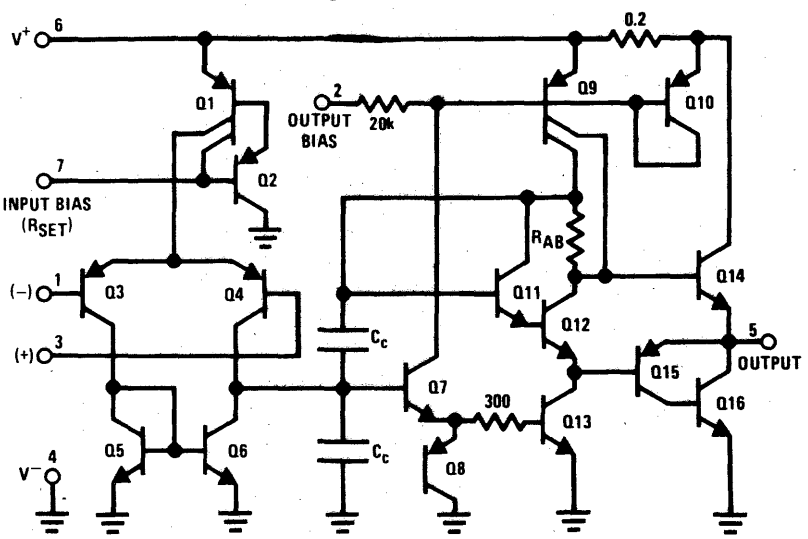
LM13080 Programmable Power Op Amp

General Description

The LM13080 is an internally compensated medium power operational amplifier designed for use in those applications requiring load currents of several hundred milliamperes. This amplifier has the added advantage of having an input stage programmed with an external resistor. The user is able to optimize the amplifier performance for each individual application with this feature. Applications include servo amplifiers and drivers, high input impedance audio amplifiers, DC-to-DC converters, precision power comparators which can either sink or source current and motor speed controls.

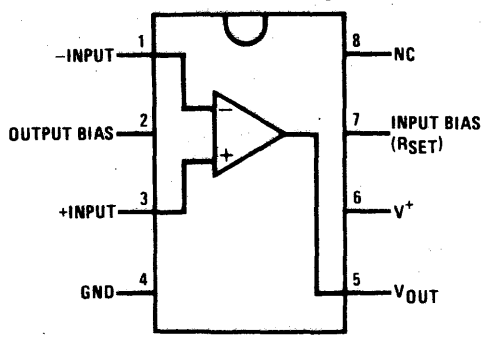
The LM13080 may be powered from either single or dual power supplies, and will operate from as little as 3V.

As a power operational amplifier, the LM13080 is capable of delivering 0.25A to a load. This feature allows the system designer to fulfill his medium power circuit requirements without having to add external current boost transistors to the output of a standard operational amplifier.



By selecting the proper input stage bias resistor it is possible to tailor the performance of the input stage to meet the needs of any particular system. Trade-offs between input offset voltage, input bias current and gain bandwidth are easily made.

An unusual feature of the LM13080 is an electronic shut-down capability.



Features

- High output current—250 mA
- Externally programmable input stage
- Low power supply operation—3V
- Electronic shut-down capability
- Internally compensated for unity gain
- Low input bias current

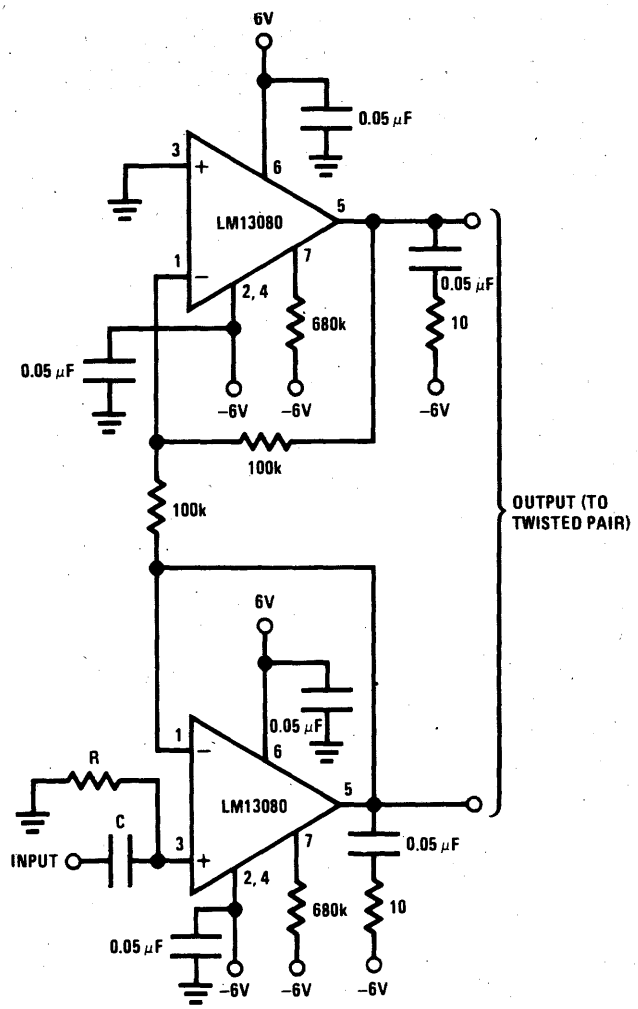
Common-Mode Rejection Ratio		63	85		dB
Total Harmonic Distortion	R_L = 8Ω, V_O = 2 Vrms, f = 1 kHz		0.5	5	%

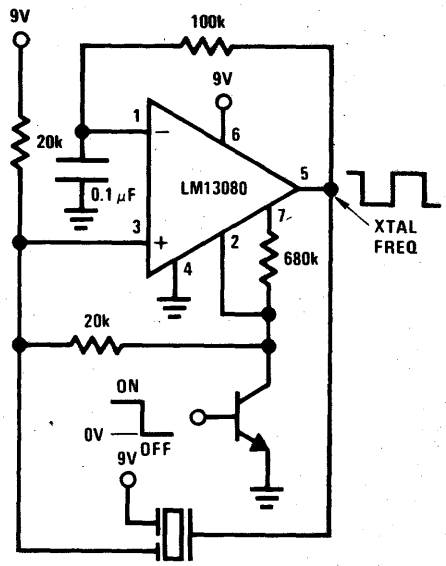
Note 1: For operation at high temperatures the LM13080 must be derated based on a maximum junction temperature of 150°C and a thermal resistance of 120°C/W. The thermal resistance value is for a package soldered into a printed circuit board and operating in a still air ambient.

Note 2: Differential input voltages up to the magnitude of the power supply voltage will not damage the input circuitry. However, input voltages outside the input common-mode voltage range will not be able to properly control the output of the amplifier.



Note 3: The input voltage applied to either input should not be allowed to go more than 0.3V below the potential applied to pin 4; however, either input can be taken as high as 15V without causing damage to the circuit. Input voltages below the minimum common-mode voltage range may cause a phase reversal in the output.

Note 4: This input current will exist only when the voltage at either input lead is driven negative. It is due to the base-isolation junction of the PNP transistor tub becoming forward biased and thereby acting as an input diode clamp. In addition to this diode action, there is also lateral NPN parasitic action on the IC chip. This transistor action can cause the output to take an undefined state for the time duration that an input is driven negative.



Note 5: V_O = 6V, R_S = 0Ω, and over the full input common-mode voltage range.

Note 6: Supply current is measured with the amplifier connected in a unity gain follower configuration and the positive input set to one-half of the supply voltage.

Voltage Regulators

LM1524/LM2524/LM3524
Regulating Pulse Width Modulator

General Description

The LM1524 series of regulating pulse width modulators contains all of the control circuitry necessary to implement switching regulators of either polarity, transformer coupled DC to DC converters, transformerless polarity converters and voltage doublers, as well as other power control applications. This device includes a 5V voltage regulator capable of supplying up to 50 mA to external circuitry, a control amplifier, an oscillator, a pulse width modulator, a phase splitting flip-flop, dual alternating output switch transistors, and current limiting and shutdown circuitry. Both the regulator output transistor and each output switch are internally current limited and, to limit junction temperature, an internal thermal shutdown circuit is employed. The LM1524 series will be available in the 16-pin dual-in-line J package with either a military, industrial or commercial temperature range.

Features

- Complete PWM power control circuitry
- Frequency adjustable to greater than 100 kHz
- 2% frequency stability with temperature
- Total quiescent current less than 10 mA
- Dual alternating output switches for both push-pull or single-ended applications
- Current limit amplifier provides external component protection
- On-chip protection against excessive junction temperature and output current—thermal limit
- 5V, 50 mA linear regulator output available to user

Typical Applications

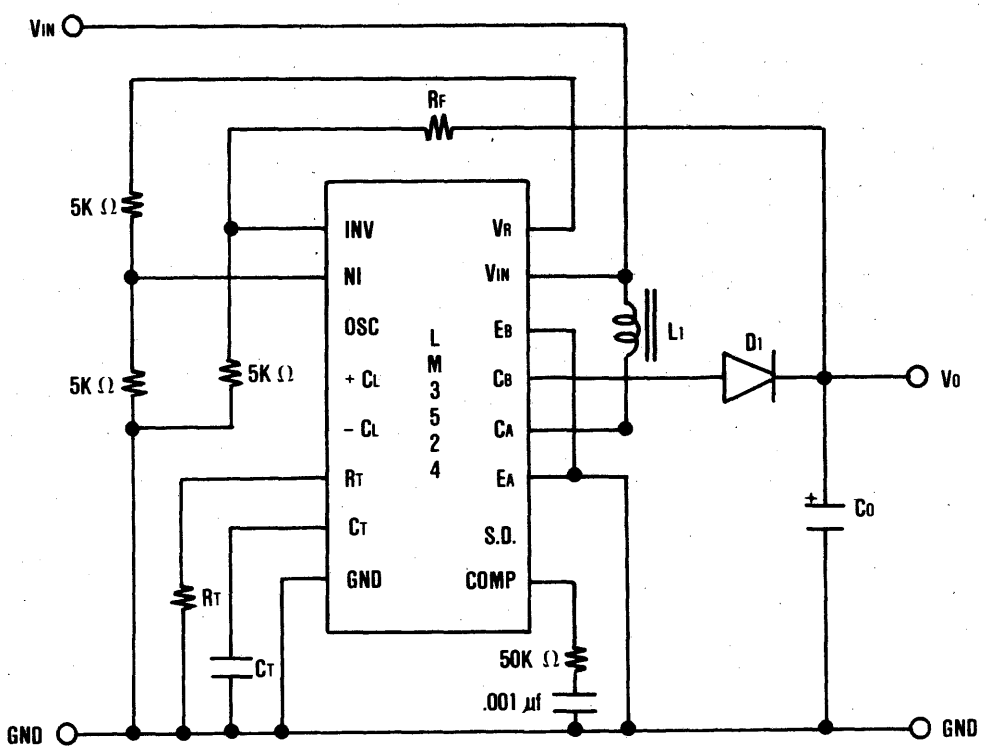

FIGURE 7: Positive Regulator, Set-Up Basic Configuration ($I_{IN\ MAX}$ = 80mA)

DESIGN EQUATIONS

$$R_F = 5K\left(\frac{V_O}{2.8} - 1\right)$$

$$f_{OSC} \simeq \frac{1}{(.5)\,R_T C_T}$$

$$L_1 = \frac{2.5 V_{IN}^2 (V_O - V_{IN})}{f\, I_O\, V_O^2}$$

$$C_O = \frac{I_O (V_O - V_{IN})}{f\ \Delta V_O\, V_O}$$

$$I_{O_{MAX}} = I_{IN}\frac{V_{IN}}{V_O}$$

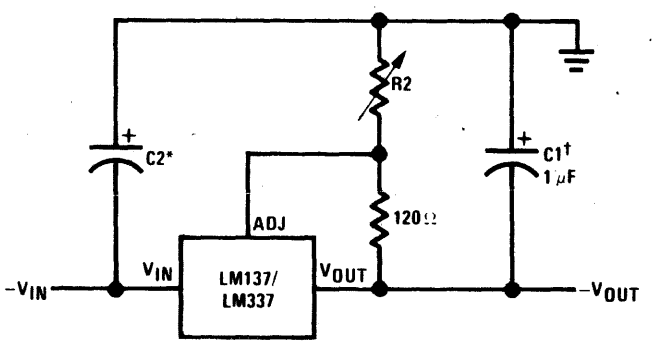
LM137/LM237/LM337 3-Terminal Adjustable Negative Regulators

General Description

The LM137/LM237/LM337 are adjustable 3-terminal negative voltage regulators capable of supplying in excess of −1.5A over an output voltage range of −1.2V to −37V. These regulators are exceptionally easy to apply, requiring only 2 external resistors to set the output voltage and 1 output capacitor for frequency compensation. The circuit design has been optimized for excellent regulation and low thermal transients. Further, the LM137 series features internal current limiting, thermal shutdown and safe-area compensation, making them virtually blowout-proof against overloads.

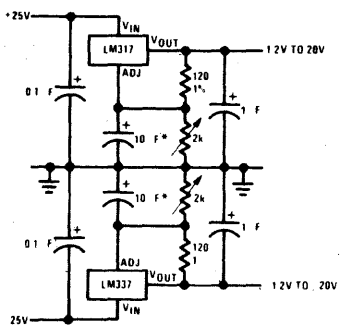


The LM137/LM237/LM337 serve a wide variety of applications including local on-card regulation, programmable-output voltage regulation or precision current regulation. The LM137/LM237/LM337 are ideal complements to the LM117/LM217/LM317 adjustable positive regulators.

Features

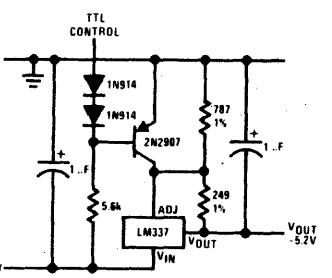
- Output voltage adjustable from −1.2V to −37V
- 1.5A output current guaranteed, −55°C to +150°C
- Line regulation typically 0.01%/V
- Load regulation typically 0.3%
- Excellent thermal regulation, 0.002%/W
- 77 dB ripple rejection
- Excellent rejection of thermal transients
- 50 ppm/°C temperature coefficient
- Temperature-independent current limit
- Internal thermal overload protection
- 100% electrical burn-in
- Standard 3-lead transistor package

Typical Applications



Adjustable Negative Voltage Regulator

$$-V_{OUT} = -1.25V\left(1 + \frac{R2}{120\Omega}\right)$$



†C1 = 1 μF solid tantalum or 10 μF aluminum electrolytic required for stability
*C2 = 1 μF solid tantalum is required only if regulator is more than 4" from power-supply filter capacitor

Adjustable Lab Voltage Regulator

*The 10 μF capacitors are optional to improve ripple rejection

−5.2V Regulator with Electronic Shutdown*

*Minimum output ≈ −1.3V when control input is low

LM150/LM250/LM350
3 Amp Adjustable Power Regulators

General Description

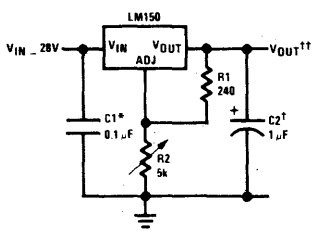
The LM150/LM250/LM350 are adjustable 3-terminal positive voltage regulators capable of supplying in excess of 3A over a 1.2V to 33V output range. They are exceptionally easy to use and require only 2 external resistors to set the output voltage. Further, both line and load regulation are comparable to discrete designs. Also, the LM150 is packaged in standard transistor packages which are easily mounted and handled.

In addition to higher performance than fixed regulators, the LM150 series offers full overload protection available only in IC's. Included on the chip are current limit, thermal overload protection and safe area protection. All overload protection circuitry remains fully functional even if the adjustment terminal is accidentally disconnected.

Normally, no capacitors are needed unless the device is situated far from the input filter capacitors in which case an input bypass is needed. An optional output capacitor can be added to improve transient response. The adjustment terminal can be bypassed to achieve very high ripple rejections ratios which are difficult to achieve with standard 3-terminal regulators.

Besides replacing fixed regulators or discrete designs, the LM150 is useful in a wide variety of other applications. Since the regulator is "floating" and sees only the input-to-output differential voltage, supplies of several hundred volts can be regulated as long as the maximum input to output differential is not exceeded.

Also, it makes an especially simple adjustable switching regulator, a programmable output regulator, or by connecting a fixed resistor between the adjustment and output, the LM150 can be used as a precision current regulator. Supplies with electronic shutdown can be achieved by clamping the adjustment terminal to ground which programs the output to 1.2V where most loads draw little current.



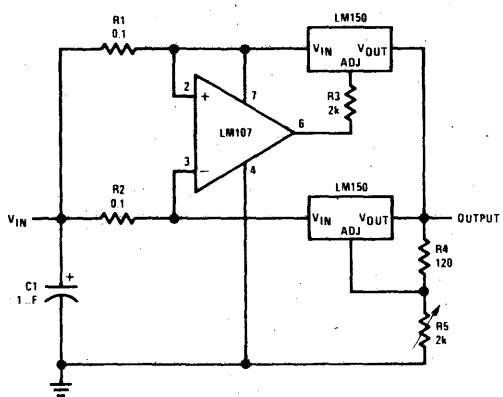
The LM150/LM250/LM350 are packaged in standard steel TO-3 transistor packages. The LM150 is rated for operation from −55°C to +150°C, the LM250 from −25°C to +150°C and the LM350 from 0°C to +125°C.

Features

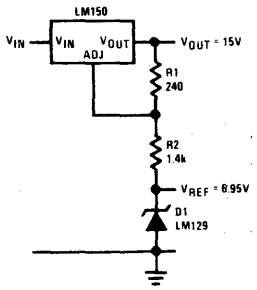
- Adjustable output down to 1.2V
- Guaranteed 3A output current
- Line regulation typically 0.005%/V
- Load regulation typically 0.1%
- Guaranteed thermal regulation
- Current limit constant with temperature
- **100% electrical burn-in in thermal limit**
- Eliminates the need to stock many voltages
- Standard 3-lead transistor package
- 86 dB ripple rejection

Typical Applications

1.2V–25V Adjustable Regulator



†Optional—improves transient response



*Needed if device is far from filter capacitors

††$V_{OUT} = 1.25V \left(1 + \frac{R2}{R1}\right)$

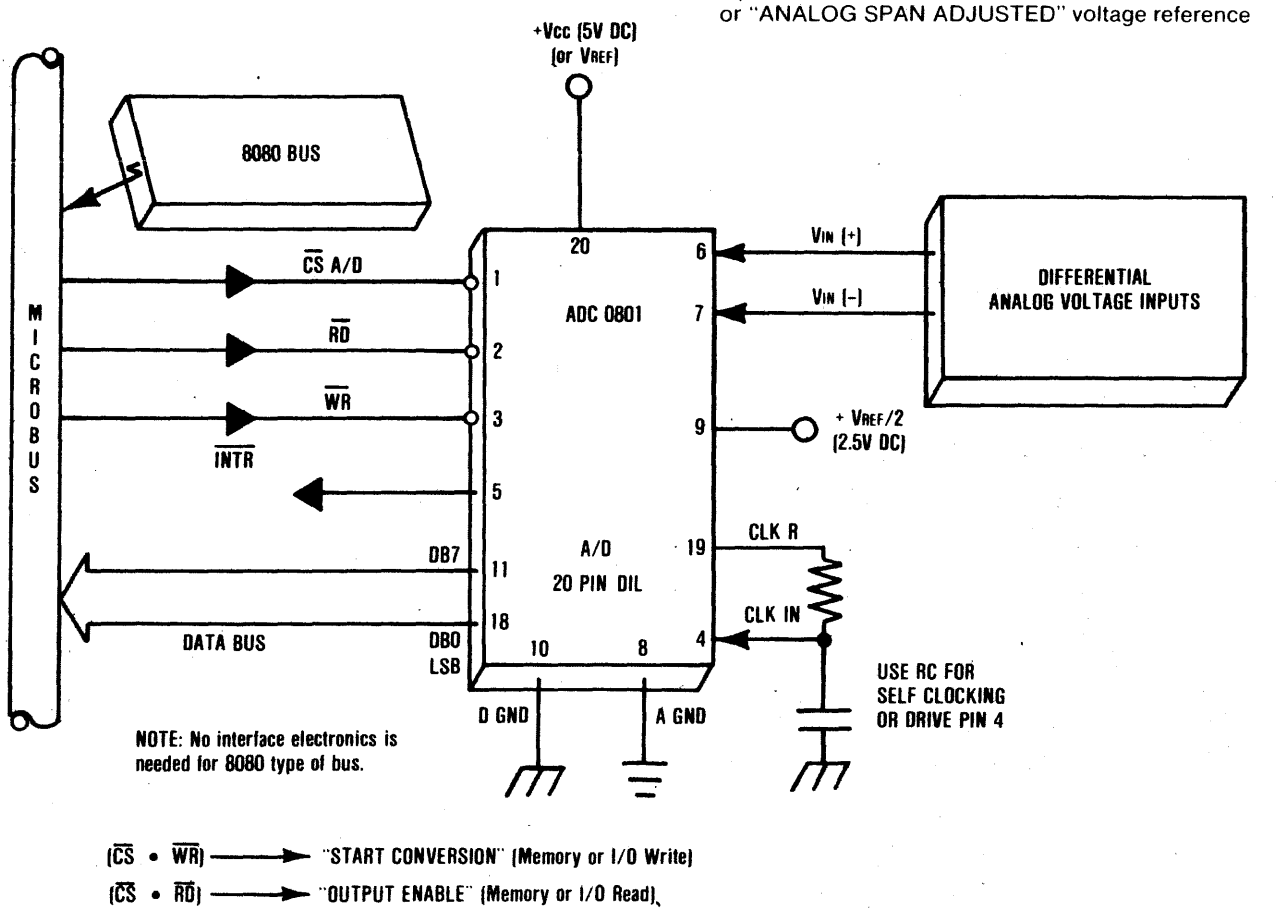
The "NAKED-8"™

ADC 0801 8 Bit, μP Interfaced, Differential Input A/D

General Description

The ADC 0801 is a μP compatible, advanced CMOS/SiCr 8 Bit successive approximation A/D converter which uses a modified potentiometric ladder-similar to the 256 R products. It is designed to meet the NSC microbus™ standard to allow operation with the 8080 control bus. The "TRI-STATE"® output latches directly drive the data bus. This A/D appears like a memory location or an I/O port to the μP and no interfacing logic is needed.

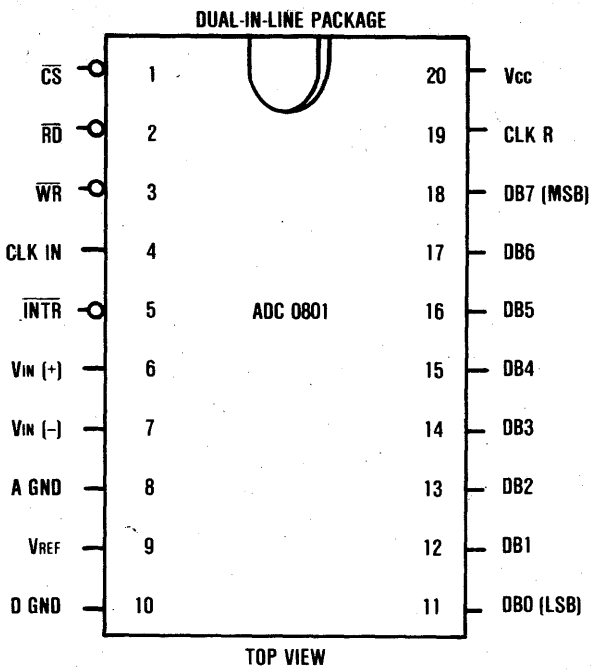
A new differential analog voltage input allows many novel applications such as increasing the common-mode rejection and offsetting the analog "ZERO" input voltage value. In addition, the voltage reference input can be adjusted to allow encoding any smaller analog voltage span to the full 8 bits of resolution.



Features

- Microbus™ (8080) compatible—no interfacing logic needed
- Easy interface to all μP's
- New analog differential voltage inputs—has both VIN (+) & VIN (-) pins
- MOS logic inputs which meet T²L voltage level specifications
- Works with 5V or 2.5V (LM336) voltage reference
- On-chip clock generator. (with external R, C)
- 0 to 5V analog input voltage range with single 5V supply
- 0.3" std. width 20 pin DIL pkg.

Key Specification



- Resolution: 8 Bits
- Linearity: ± 1/2 LSB
- Converstion time (Vcc = 6V): 50 μs
- Single supply: 5V DC
- Clock range 100 kHz to 1.28 MHz
- Operates ratiometric or with +5V DC, +2.5V DC, or "ANALOG SPAN ADJUSTED" voltage reference

TYPICAL APPLICATION

©IC MASTER 1979

CONNECTION DIAGRAM

20 PIN 0.3" WIDE DIL PACKAGE

Operation

The ADC 0801 contains a circuit equivalent of the 256R network. Analog switches are sequenced by successive approximation logic to match the analog difference input voltage [V_{IN} (+) - V_{IN} (-)] to a corresponding tap on the R network. The most significant bit is tested first and after 8 comparisons (64 clock cycles) a digital 8 bit binary code (1111 1111 = full scale) is transferred to an output latch and then an interrupt is asserted ($\overline{INTR}$ makes a high to low transition). The device may be operated in the free running mode by connecting $\overline{INTR}$ to the $\overline{WR}$ input with $\overline{CS}$ = 0. To insure start-up under all possible conditions, an external $\overline{WR}$ pulse is required during the first power up cycle. A conversion in process can be interrupted by issuing a second "start" command.

On the high to low transition of the $\overline{WR}$ input, the internal SAR latches and the shift register stages are reset. As long as the $\overline{CS}$ input and $\overline{WR}$ input remain low, the A/D will remain in a reset state. Conversion will not start until from 1 to 8 clock periods after at least one of these inputs makes a low to high transition.

Functional Description

DIGITAL CONTROL INPUTS

The digital control inputs ($\overline{CS}$, $\overline{RD}$, and $\overline{WR}$) have been designed to meet standard T^2L logic voltage levels. These signals have been re-named when compared to the "standard" A/D "START" and "OUTPUT ENABLE" labels. In addition, these inputs are active low to allow an easy interface to μP control busses. For non-μP based applications, the $\overline{CS}$ input (pin 1) can be grounded and the "standard" A/D "START" function is obtained by an active low pulse applied at the $\overline{WR}$ input (pin 3) and the "OUTPUT ENABLE" function is caused by an active low pulse at the $\overline{RD}$ input (pin 2).

THE ANALOG DIFFERENTIAL VOLTAGE INPUTS

This A/D has additional applications flexibility due to the unique analog differential voltage input feature. The V_{IN} (-) input (pin 7) can be used for "tare" correction to automatically subtract a fixed voltage value from the output reading. This is also useful in 4-20mA current loop conversion. In addition, "ground noise" problems can be reduced by making use of the differential input - especially when a dual sample and hold circuit is used (see applications section).

Finally, an analog input voltage with a reduced span and a relatively large "zero" offset can be easily handled by making use of the differential input (see the next section on the reference voltage).

The leads to the analog inputs (pins 6 and 7) should be kept as short as possible. Both noise and undesired digital clock coupling to these inputs can cause system errors. The source resistance for these inputs should be kept below 5 kΩ. If a low pass filter is required in the system, use a low valued series resistor ($\leq$ 5 kΩ) for a passive RC section or add an op amp RC active low pass filter. For low source resistance applications, a 0.1μF by-pass capacitor at the inputs will prevent pickup due to series lead inductance and a 1 kΩ series resistor can be used to isolate this capacitor from the output of an op amp (if used).

INPUT CURRENT

Due to the successive approximation switching action, currents will flow at the analog inputs. This is due to on-chip parasitic capacitance to ground. The voltage on this capacitor is switched and will result in currents entering or leaving the input pins which will depend on the analog input voltage levels. This "charge pumping" action is worse for continuous conversions with the analog input voltages at zero or full scale.

By-pass capacitors at the inputs will average these charges and cause a dc current to flow through the output resistances of the analog signal sources. For continuous conversions with a high clock frequency (fclk = MHz) with the analog inputs at zero volts, this dc current is at a maximum of approximately 1μA.

OFFSETTING ZERO

The zero of the A/D does not require adjustment. If the minimum analog input voltage value, VIN (min.), is above ground, a zero offset can be done. The converter can be made to output 0000 0000 digital code for this minimum input voltage by biasing the A/D VIN (-) input at this VIN (min.) value. This is making use of the differential mode operation of the A/D.

FULL SCALE ADJUSTMENT

The full scale adjustment can be made by applying a voltage which is 1-1/2 LSB of the desired analog voltage range to the VIN (+) input and then adjusting the magnitude of the VREF input (pin 9) for a digital output code which is just changing from "1111 1110" to "1111 1111".

REFERENCE VOLTAGE FLEXIBILITY

For maximum applications flexibility, the reference voltage has been designed to accommodate a +5VDC, +2.5VDC or an "adjusted" voltage level. This has been achieved in the design of the IC as shown in figure 1.

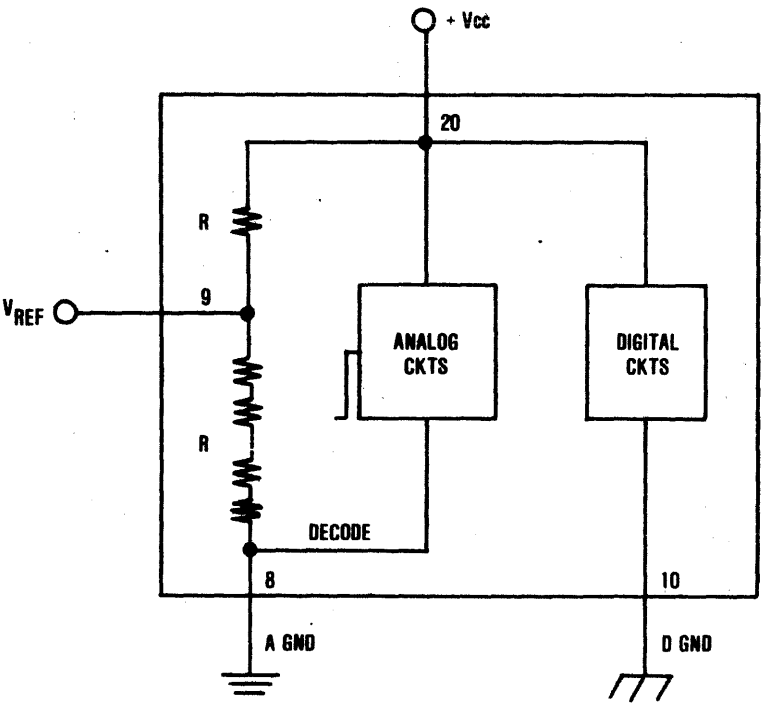


FIGURE 1: The $V_{REFERENCE}$ design on the IC

Notice that the reference voltage to the IC is either 1/2 of the voltage which is applied to the +Vcc supply pin, or is equal to the voltage which is externally "forced" to exist at the VREF pin. This allows for a ratiometric voltage reference using the +Vcc supply (where a capacitor can be connected from VREF to ground for noise rejection), a +5VDC reference voltage can be used for the +Vcc supply or any voltage can be applied to the VREF input for increased application flexibility. The internal "gain" to the VREF input is 2 to allow this factor of 2 reduction in the VREF voltage.

An example of the use of an "adjusted" reference voltage is to accommodate a reduced span - or dynamic voltage range of the analog input voltage. If the analog input voltage were to range from 0.5VDC to 3.5VDC, (instead of 0V to 5VDC) the span would be 3V. With +0.5VDC applied to the VIN (-) pin to absorb the "offset", the reference voltage can be made equal to 1/2 of the 3V span or +1.5VDC. The A/D now will encode the VIN (+) signal from 0.5V to 3.5V with the 0.5V input corresponding to "zero" and the +3.5VDC input corresponding to "full scale". The full 8 bits of resolution are therefore applied over this reduced analog input voltage range.

©IC MASTER 1979

SELF-CLOCKING OPTION

The clock for the A/D can be derived from the CPU clock or an external RC can be added to provide self-clocking. The "CLK IN" (pin 4) makes use of a Schmitt trigger as shown in figure 2.

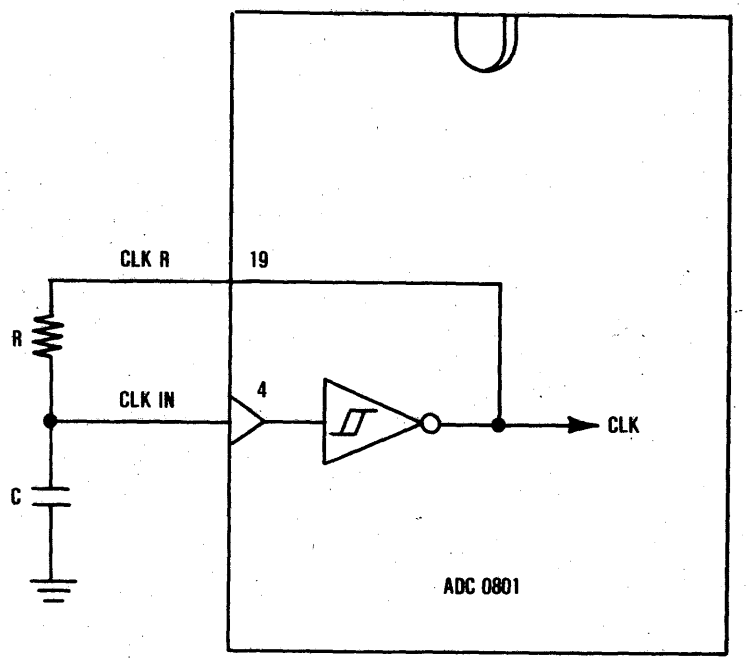

FIGURE 2: Self-clocking the A/D

Typical Applications

I. Interfacing 8080 μP Deviatives (8048, 8085)

This converter has been designed to directly interface with an 8080 A-2 μP (MICROBUS™ class 2). The A/D can be "mapped" into memory space (using standard memory address decoding for $\overline{CS}$ and the $\overline{MEMR}$ and $\overline{MEMW}$ strobes) or it can be controlled as an I/O device by using the $\overline{I/O\ R}$ and $\overline{I/O\ W}$ strobes and decoding the address bits $A_0 \rightarrow A_7$ (or address bits $A_8 \rightarrow A_{15}$ as they will contain the same 8 bit address information) to obtain the $\overline{CS}$ input. Using the I/O space provides 256 additional addresses and may allow a simpler 8 bit address decoder but the data can only be input to the accumulator, figure 3. To make use of the additional memory referenced instructions, the A/D should be "mapped" into memory space.

The standard control bus signals of the 8080 ($\overline{CS}$, $\overline{RD}$ and $\overline{WR}$) can be directly wired to the digital control inputs of the A/D and the bus timing requirements are met to allow both starting the converter and the outputting of the data onto the data bus. A bus driver should be used for larger μP systems where the data bus leaves the PC board and/or must drive capacitive loads larger than 100pF.

II. The Z-80 CPU

The Z-80 control bus is slightly different from that of the 8080. General $\overline{RD}$ and $\overline{WR}$ strobes are provided and separate memory request, $\overline{MREQ}$, and I/O request, $\overline{IORQ}$, signals are used which have to be combined with the generalized strobes to provide the equivalent 8080 signals. An advantage of operating the A/D in I/O space with the Z-80 is that the CPU will automatically insert one wait state (the $\overline{RD}$ and $\overline{WR}$ strobes are extended one clock period) to allow more time for the I/O devices to respond. Logic to map the A/D in I/O space is shown in figure 4.

III. Interfacing 6800 μP Derivatives (6502, etc.)

The control bus for the 6800 μP derivatives do not use $\overline{RD}$ and $\overline{WR}$ strobe signals. Instead they employ a single R/$\overline{W}$ line and additional synchronizing, if needed, could be derived from Ø2 clock. All I/O devices are memory mapped in the M6800 system and a special signal, VMA, indicates that the current address is valid. Figure 5 shows an interface schematic where the A/D is memory-mapped. Note that in many 6800 systems a decoded $\overline{4/5}$ line is brought out to the common bus at pin (21). This can be tied directly to the $\overline{CS}$ pin of the A/D provided that no other devices are addressed at ADDR : 4XXX or 5XXX.

FIGURE 5: ADC0801 to MC6800 CPU Interface

IV. Miscellaneous Applications

- Analog input voltage range: (V_{IN} (max) - V_{IN} (min) $< 5V$
- $\frac{Rf}{Ri} + 1 = \frac{V_{IN}\text{ (max)}}{2\ V_{IN}\text{ (min)}}$; Ri 11 R2 = Ri 11 Rf
- If V_{IN} (min) is zero, the V_{IN} (-) pin of the A/D should be grounded, the LM358 should be connected as unity gain follower, and the center point of the R1, R2 divider should be = V_{IN} (max)/2.

FIGURE 6: Offsetting the zero, and accommodating the Naked 8™ for input voltage ranges less than 0 to 5V.

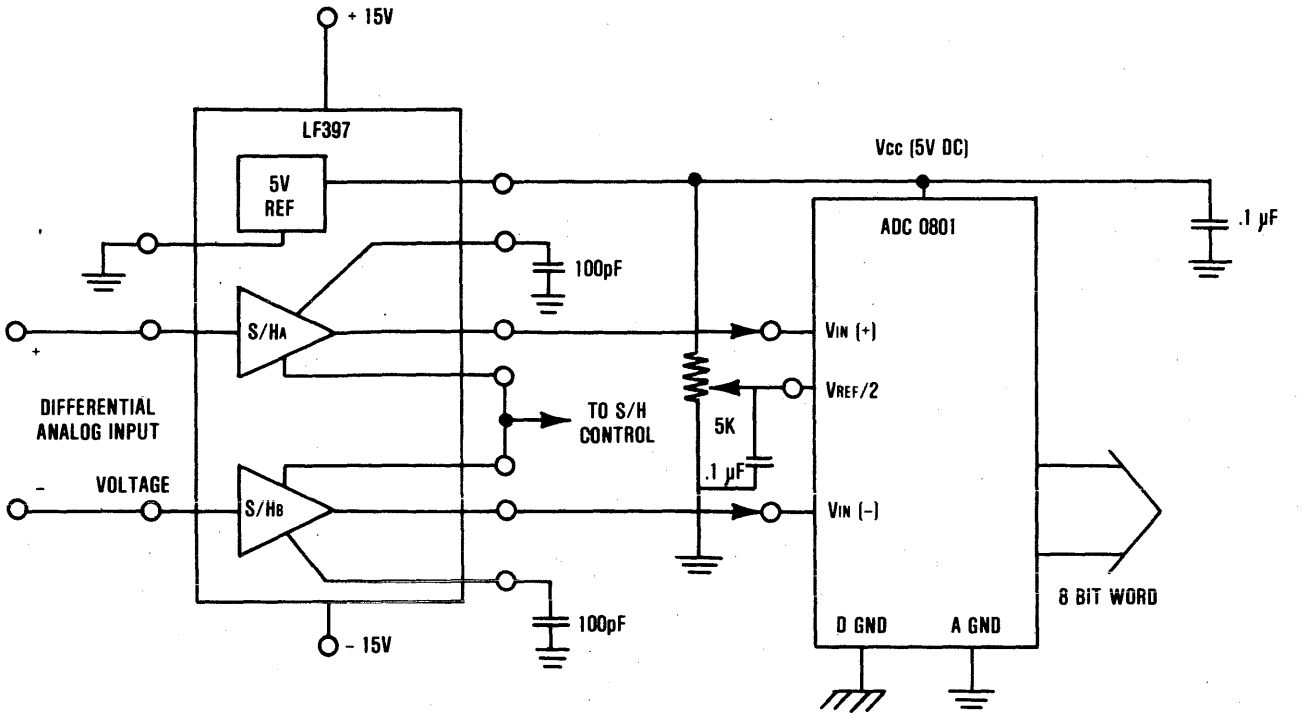

FIGURE 7: Interfacing the Naked 8™ with the LF397 data acquisition building block. The unique advantages of the Naked 8™ - DUAL S/H combination are very fast acquisition times, negligible hold mode errors and rejection of common mode signals.

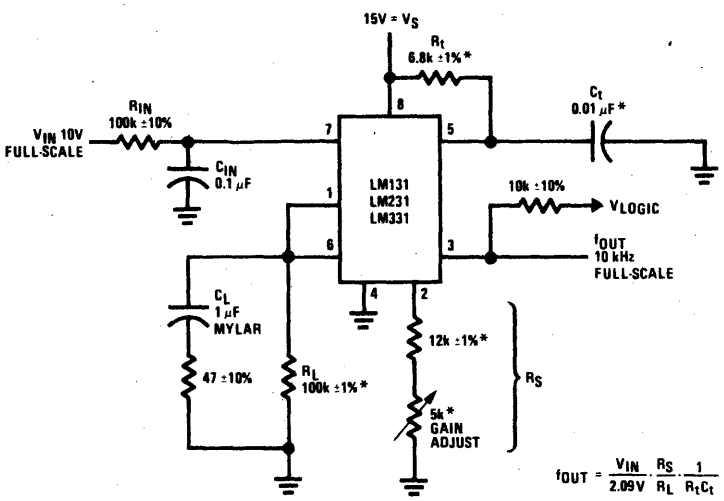
LM131A/LM131, LM231A/LM231, LM331A/LM331 Precision Voltage-to-Frequency Converters

General Description



The LM131/LM231/LM331 family of voltage-to-frequency converters are ideally suited for use in simple low-cost circuits for analog-to-digital conversion, precision frequency-to-voltage conversion, long-term integration, linear frequency modulation or demodulation, and many other functions. The output when used as a voltage-to-frequency converter is a pulse train at a frequency precisely proportional to the applied input voltage. Thus, it provides all the inherent advantages of the voltage-to-frequency conversion techniques, and is easy to apply in all standard voltage-to-frequency converter applications. Further, the LM131A/LM231A/LM331A attains a new high level of accuracy versus temperature which could only be attained with expensive voltage-to-frequency modules. Additionally the LM131 is ideally suited for use in digital systems at low power supply voltages and can provide low-cost analog-to-digital conversion in microprocessor-controlled systems. And, the frequency from a battery powered voltage-to-frequency converter can be easily channeled through a simple photoisolator to provide isolation against high common mode levels.

The LM131/LM231/LM331 utilizes a new temperature-compensated band-gap reference circuit, to provide excellent accuracy over the full operating temperature range, at power supplies as low as 4.0V. The precision timer circuit has low bias currents without degrading the quick response necessary for 100kHz voltage-to-frequency conversion. And the output is capable of driving 3 TTL loads, or a high voltage output up to 40V, yet is short-circuit-proof against V_{CC}.

Features

- Guaranteed linearity 0.01% max
- Improved performance in existing voltage-to-frequency conversion applications
- Split or single supply operation
- Operates on single 5V supply
- Pulse output compatible with all logic forms
- Excellent temperature stability, ±50ppm/°C max
- Low power dissipation, 15mW typical at 5V
- Wide dynamic range, 100dB min at 10kHz full scale frequency
- Wide range of full scale frequency, 1Hz to 100kHz
- Low cost

Typical Applications

*Use stable components with low temperature coefficients. See applications notes.

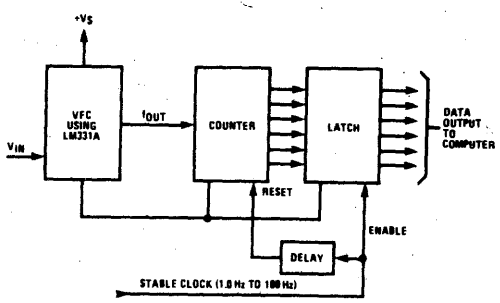
	V_S = 40V	2.0	4.0	8.0	mA

Note 1: All specifications apply in the circuit of *Figure 3*, with $4.0V \leq V_S \leq 40V$, unless otherwise noted.

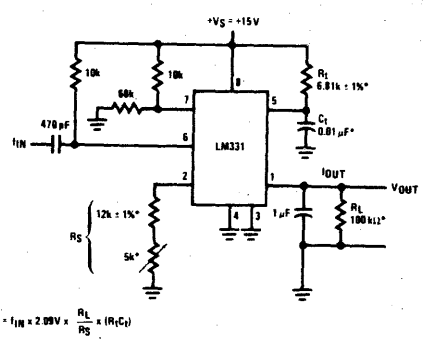
Note 2: Nonlinearity is defined as the deviation of f_{OUT} from V_{IN} x (10 kHz/−10 V_{DC}) when the circuit has been trimmed for zero error at 10 Hz and at 10 kHz, over the frequency range 1 Hz to 11 kHz. For the timing capacitor, C_T, use NPO ceramic, Teflon*, or polystyrene.

Typical Applications



*Use stable components with low temperature coefficients. See applications notes.

**This resistor can be 5 kΩ or 10 kΩ for V_S = 8V to 22V, but must be 10 kΩ for V_S = 4.5V to 8V.



***Use low offset voltage and low offset current op amps for A1: recommended types LM108, LM308A, LF351B

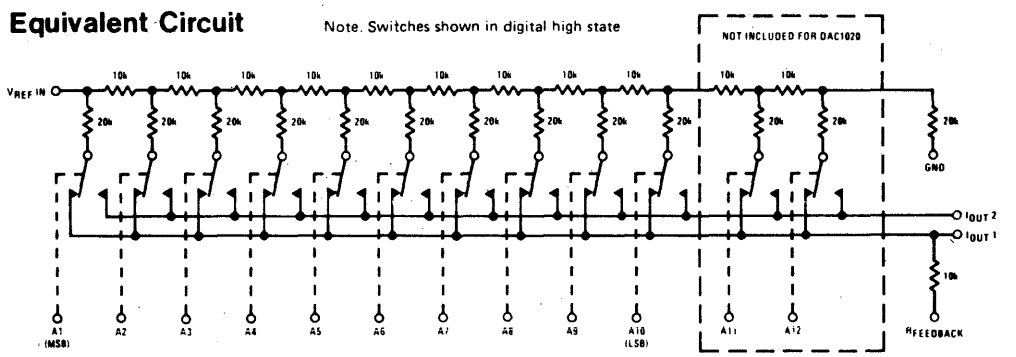
DAC1020 10-Bit Binary Multiplying D/A Converter
DAC1220 12-Bit Binary Multiplying D/A Converter

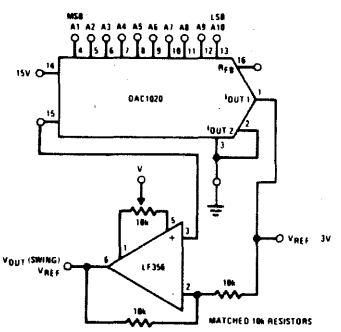
General Description

The DAC1020 and the DAC1220 are, respectively, 10 and 12-bit binary multiplying digital-to-analog converters. A deposited thin film R-2R resistor ladder divides the reference current and provides the circuit with excellent temperature tracking characteristics (0.0002%/°C linearity error temperature coefficient maximum). The circuit uses CMOS current switches and drive circuitry to achieve low power consumption (30 mW max) and low output leakages (200 nA max). The digital inputs are compatible with DTL/TTL logic levels as well as full CMOS logic level swings. This part, combined with an external amplifier and voltage reference, can be used as a standard D/A converter; however, it is also very attractive for multiplying applications (such as digitally controlled gain blocks) since its linearity error is essentially independent of the voltage reference. All inputs are protected from damage due to static discharge by diode clamps to V^+ and ground.



This part is available with 10-bit (0.05%), 9-bit (0.10%), and 8-bit (0.20%) non-linearity guarenteed over temperature (note 1 of electrical characteristics). The DAC1020, DAC1021, and DAC1022 are direct replacements for the 10-bit resolution AD7520 and AD7530 family. The DAC1220, DAC1221, and DAC1222 are direct replacements for the 12-bit resolution AD7521 and AD7531 family.

Features

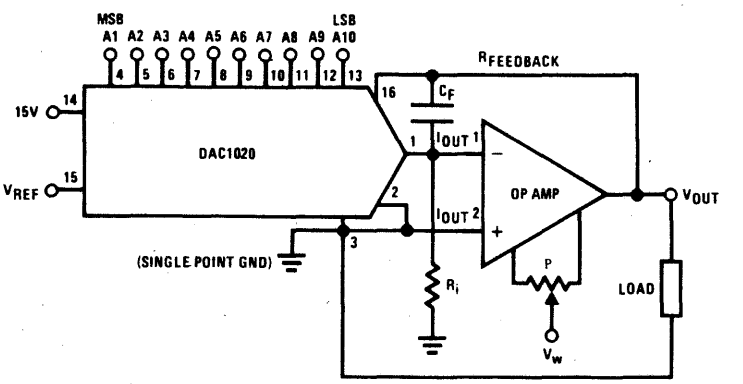


- Non-linearity guaranteed over temperature
- Integrated thin film on CMOS structure
- 10-bit or 12-bit resolution
- Low power dissipation 10 mW @ 15V typ
- Accepts variable or fixed reference $-25V \leq V_{REF} \leq +25V$
- 4-quadrant multiplying capability
- Interfaces directly with DTL, TTL and CMOS
- Fast settling time—500 ns typ
- Low feedthrough error—1/2 LSB @ 100 kHz typ

Equivalent Circuit

Note. Switches shown in digital high state

Typical Applications



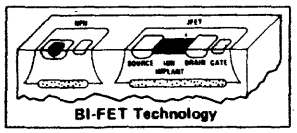
TRUE OFFSET BINARY OPERATION

DIGITAL INPUT										V_{OUT}
1	1	1	1	1	1	1	1	1	1	$V_{REF} \times 1022/1024$
1	0	0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0	0	$-V_{REF}$

$t_S = 1.8\ \mu s$
use LM336 for a voltage reference

Bipolar Configuration with a Single Op Amp

$$V_{OUT} = -V_{REF}\left(\frac{A1}{2} + \frac{A2}{4} + \frac{A3}{8} + \ldots \frac{A10}{1024}\right)$$



$-10V \leq V_{REF} \leq 10V$

$0 \leq V_{OUT} \leq -\frac{1023}{1024} V_{REF}$

where $A_N = 1$ if the A_N digital input is high
$A_N = 0$ if the A_N digital input is low

Basic Connection: Unipolar or 2-Quadrant Multiplying Configuration (Digital Attenuator)

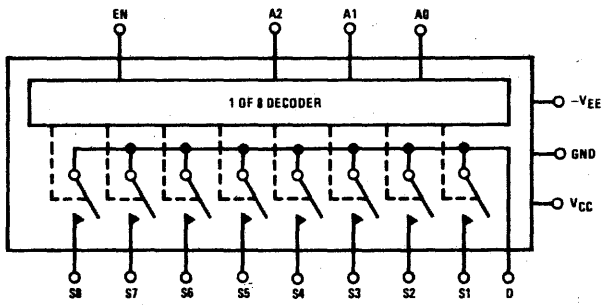
LF11508/LF12508/LF13508
8-channel analog multiplexer
LF11509/LF12509/LF13509
4-channel differential analog multiplexer

general description

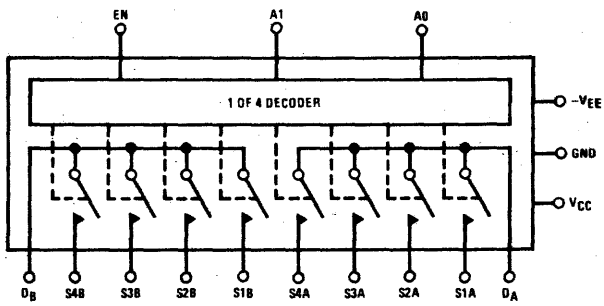
The LF11508/LF12508/LF13508 is an 8-channel analog multiplexer which connects the output to 1 of the 8 analog inputs depending on the state of a 3-bit binary address. An enable control allows disconnecting the output, thereby providing a package select function.

This device is fabricated with National's BI-FET technology which provides ion-implanted JFETs for the analog switch on the same chip as the bipolar decode and switch drive circuitry. This technology makes possible low constant "ON" resistance with analog input voltage variations. This device does not suffer from latch-up problems or static charge blow-out problems associated with similar CMOS parts. The digital inputs are designed to operate from both TTL and CMOS levels while always providing a definite break-before-make action.



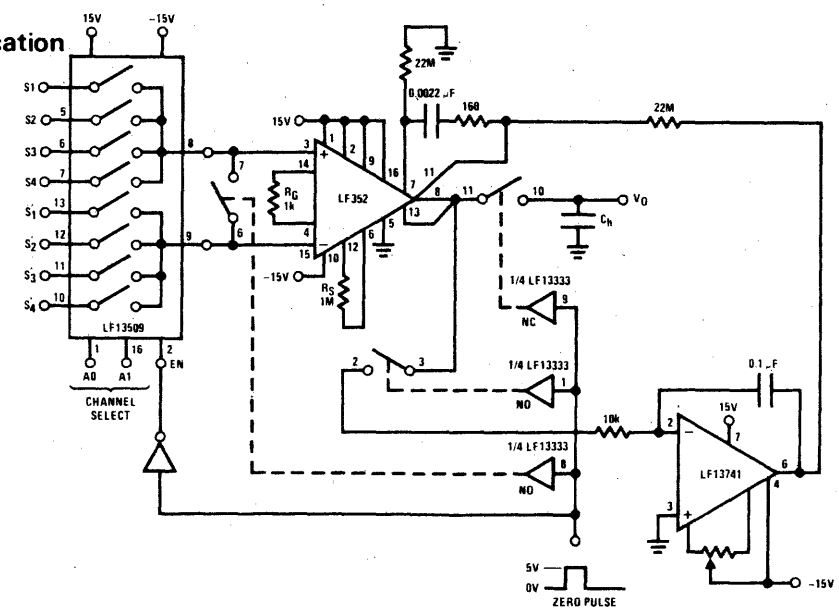
The LF11509/LF12509/LF13509 is a 4-channel differential analog multiplexer. A 2-bit binary address will connect a pair of independent analog inputs to one of any 4 pairs of independent analog outputs. The device has all the features of the LF11508 series and should be used whenever differential analog inputs are required.

features



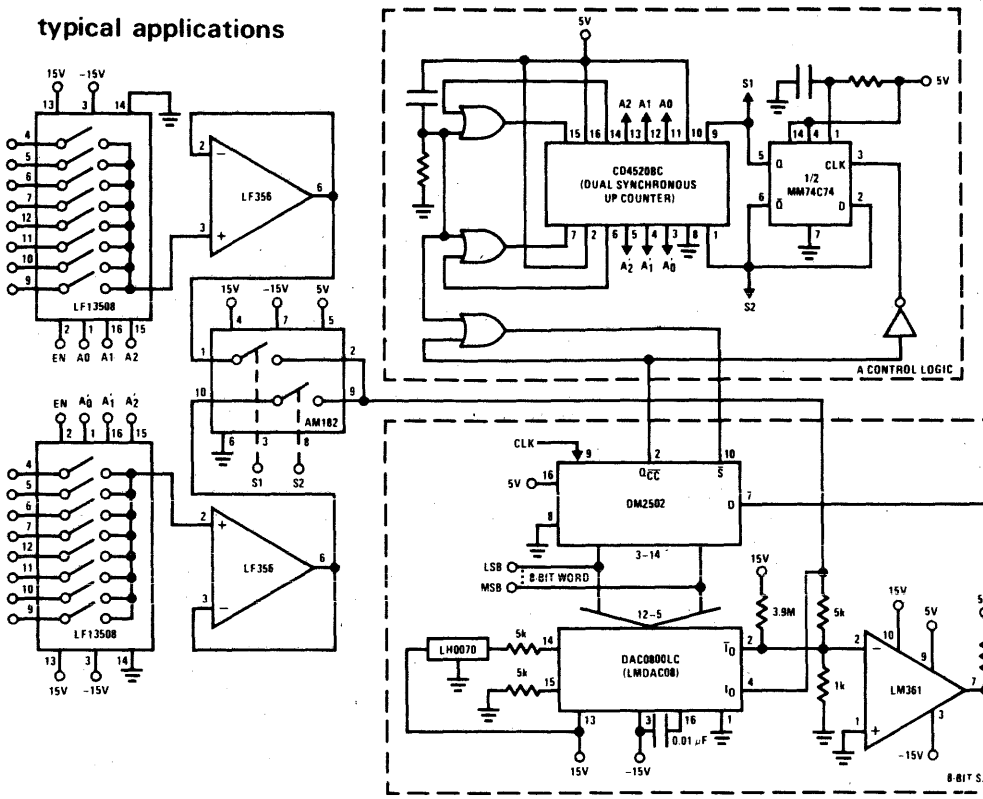
- JFET switches rather than CMOS
- No static discharge blow-out problem
- No SCR latch-up problems
- Analog signal range 11V, −15V
- Constant "ON" resistance for analog signals between −11V and 11V
- "ON" resistance 380 Ω typ
- Digital inputs compatible with TTL and CMOS
- Output enable control
- Break-before-make action: t_{OFF} = 0.2 μs; t_{ON} = 2 μs typ

functional diagrams

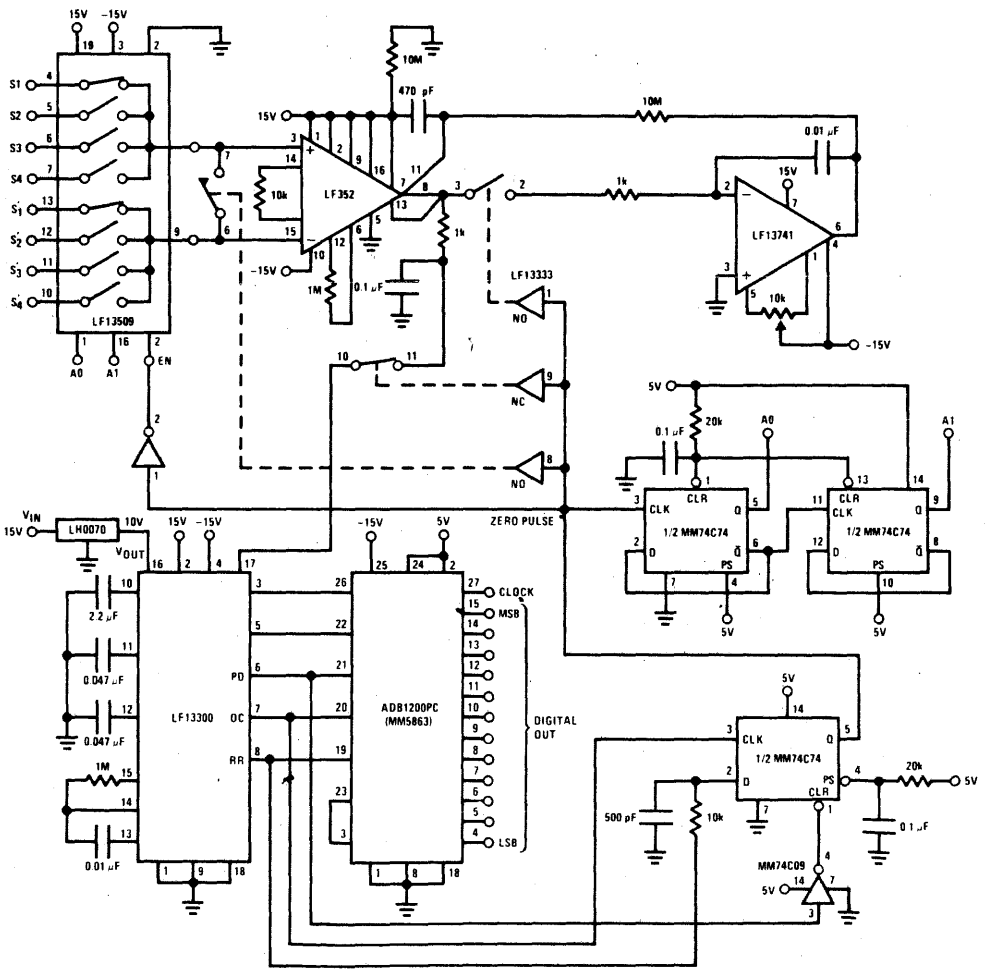


LF11508/LF12508/LF13508

LF11509/LF12509/LF13509



typical application



- Differential multiplexer disabled during auto zeroing
- Minimum zeroing pulse width will depend upon the integrator R1C
- This scheme provides input offset adjust especially useful with high gain connections. The device, LF352, provides pins for output offset adjust. For more details, see LF352 data sheet.

4-Channel Differential Multiplexer with Auto Zeroed Instrumentation Amplifier

A Fast 16-Channel DAU with Second Level Multiplexing

- f_{CLOCK} max = 200 kHz
- The LF352 instrumentation amplifier is auto zeroed during offset correction cycle of the LF13300 A/D
- The system accuracy will mostly depend on the instrumentation amplifier gain linearity

4-Channel Differential Multiplexer with Auto Zeroed Instrumentation Amplifier and 12-Bit A/D Converter

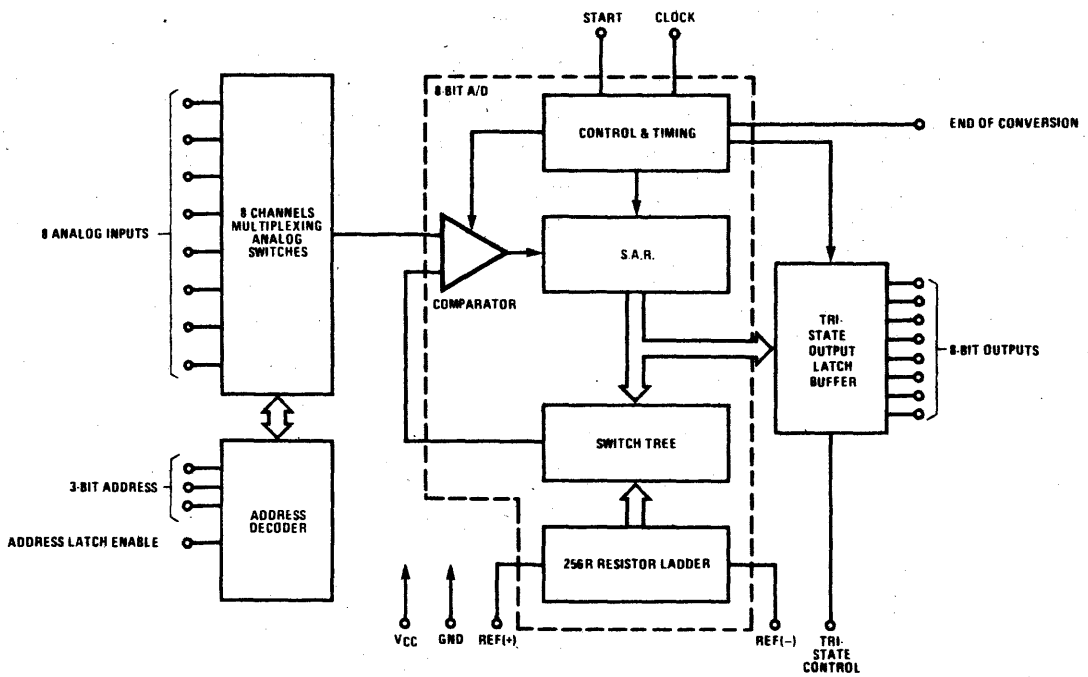
Analog-to-Digital Converters

ADC0808, ADC0809 Single Chip Data Acquisition System

General Description

The ADC0808, ADC0809 data acquisition components are monolithic CMOS devices with an 8-bit analog-to-digital converter, 8-channel multiplexer and microprocessor compatible control logic. The 8-bit A/D converter uses successive approximation as the conversion technique. The converter features a high impedance chopper stablilzed comparator, a 256R voltage divider with analog switch tree and a successive approximation register. The 8-channel multiplexer can directly access any one of 8-single-ended analog signals.



The device eliminates the need for external zero and full-scale adjustments and features an absolute accuracy $\leq$ 1 LSB including quantizing error. Easy interfacing to microprocessors is provided by the latched and decoded address inputs and latched TTL TRI-STATE® outputs.

The design of the ADC0808, ADC0809 has been optimized by incorporating the most desirable aspects of several A/D conversion techniques. The ADC0808, ADC0809 offers high speed, high accuracy, minimal temperature dependence, excellent long-term accuracy and repeatability, and consumes minimal power. These features make this device ideally suited to applications such as process control, industrial control, and machine control. For 16-channel multiplexer with common output (sample/hold port) see ADC0816 data sheet.

Features

- Total unadjusted error $<$ ±1/2 LSB
- Linearity error $<$ ±1/2 LSB
- No missing codes
- Guaranteed monotonicity
- No offset adjust required
- No scale adjust required
- Conversion time of 100 μs
- Easy microprocessor interface
- Latched TRI-STATE output
- Latched address input
- Ratiometric conversion
- Single 5V supply
- Low power consumption—15 mW
- Full −55°C to +125°C operation available

Block Diagram

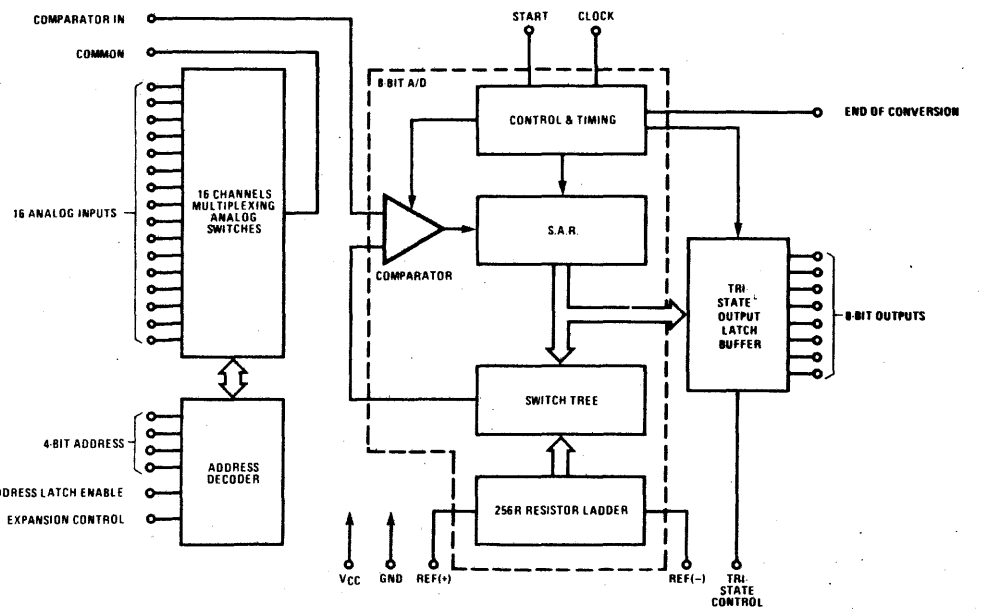
ADC0816/ADC0817 Single Chip Data Acquisition System

General Description

The ADC0816, ADC0817 (MM74C948) data acquisition components are monolithic CMOS devices with an 8-bit analog-to-digital converter, a 16-channel multiplexer and microprocessor compatible control logic. The 8-bit A/D converter uses successive approximation as the conversion technique. The converter features a high impedance chopper stabilized comparator, a 256R voltage divider with analog switch tree and a successive approximation register. The 16-channel multiplexer can directly access any one of 16 single-ended analog signals and provides the logic for additional channel expansion. Signal conditioning of any analog input signal is eased by direct access to the input of the 8-bit A/D converter.



The device eliminates the need for external zero and full-scale adjustments and features an absolute accuracy $\leq$ 1 LSB including quantitizing error. Easy interfacing to microprocessors is provided by the latched and decoded address inputs and latched TTL TRI-STATE® outputs.

The design of the ADC0816, ADC0817 has been optimized by incorporating the most desirable aspects of several A/D conversion techniques. The ADC0816, ADC0817 offers high speed, high accuracy, minimal temperature dependence, excellent long-term accuracy and repeatability, and consumes minimal power. These features make this device ideally suited to applications such as process control, industrial control, and machine control.

Features

- Total unadjusted error $<\pm$1/2 LSB
- Linearity error $<\pm$1/2 LSB
- No missing codes
- Guaranteed monotonicity
- No offset adjust required
- No scale adjust required
- Conversion time of 100 μs
- Easy microprocessor interface
- Latched TRI-STATE output
- Latched address input
- Ratiometric conversion
- Single 5V supply
- Low power consumption—15 mW

Block Diagram

Absolute Maximum Ratings (Notes 1 and 2)

Voltage at Any Pin Except Control Inputs	−0.3V to V_{CC} + 0.3V
Voltage at Control Inputs (Start, TRI-STATE, Clock, ALE, ADD A, ADD B, ADD C, ADD D, Expansion Control)	−0.3V to + 15V
Operating Temperature Range	−40°C to +85°C
Storage Temperature Range	−65°C to +150°C
Package Dissipation (at 25°C)	500 mW
Operating V_{CC} Range	4.5V to 6V
Absolute Maximum V_{CC}	6.5V
Lead Temperature (Soldering, 10 seconds)	300°C

DC Electrical Characteristics

$4.75V \leq V_{CC} \leq 5.25V$, $-40°C \leq T_A \leq +85°C$ unless otherwise noted, (Note 2)

PARAMETER		CONDITIONS	MIN	TYP	MAX	UNITS
$V_{IN(1)}$	Logical "1" Input Voltage	V_{CC} = 5V	V_{CC}−1.5			V
$V_{IN(0)}$	Logical "0" Input Voltage	V_{CC} = 5V			1.5	V
$V_{OUT(1)}$	Logical "1" Output Voltage	I_O = −360 μA	V_{CC}−0.4			V
$V_{OUT(0)}$	Logical "0" Output Voltage	I_O = 1.6 mA			0.45	V
$V_{OUT(0)}$	Logical "0" Output Voltage EOC	I_O = 1.2 mA			0.45	V
$I_{IN(1)}$	Logical "1" Input Current (The Control Inputs)	V_{IN} = 15V			1.0	μA
$I_{IN(0)}$	Logical "0" Input Current (The Control Inputs)	V_{IN} = 0	−1.0			μA
I_{CC}	Supply Current	Clock Frequency = 500 kHz		300	1000	μA
I_{OUT}	TRI-STATE Output Current	V_O = 5V			3	μA
		V_O = 0	−3			μA

Note 1: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. Except for "Operating Temperature Range" they are not meant to imply that the devices should be operated at these limits. The table of "Electrical Characteristics" provides conditions for actual device operation.

Note 2: All voltages measured with respect to GND unless otherwise specified.

Note 3: Non-linearity error is the maximum deviation from a straight line through the end points of the A/D transfer characteristic, *(Figure 2)*.

Note 4: Zero error is the difference between the output of an ideal and the actual A/D for zero input voltage, *(Figure 2)*.

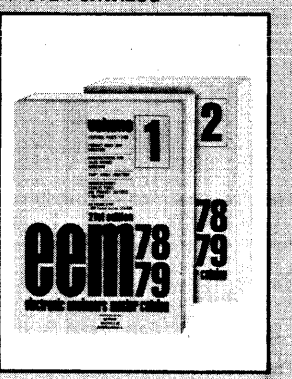
Note 5: Full-scale error is the difference between the output of an ideal and the actual A/D for full-scale input voltage, *(Figure 2)*.

Note 6: Total unadjusted error is the maximum sum of non-linearity, zero and full-scale errors, *(Figure 3)*.

Note 7: Quantization error is the ±1/2 LSB uncertainty caused by the converter's finite resolution, *(Figure 3)*.

Note 8: Absolute Accuracy describes the difference between the actual input voltage and the full-scale weighted equivalent of the binary output code; included are quantizing and all other errors. Although rarely provided on data sheets, it is the best indication of a converter's true performance, *(Figure 3)*.

Note 9: Supply rejection relates to the ability of an ADC to maintain accuracy as the supply voltage varies. The supply and $V_{REF(+)}$ are varied together and the change in accuracy is measured with respect to full-scale.



Note 10: Comparator input current is a bias current into or out of the chopper stabilized comparator. The bias current varies directly with clock frequency and has little temperature dependence, *(Figure 5)*.

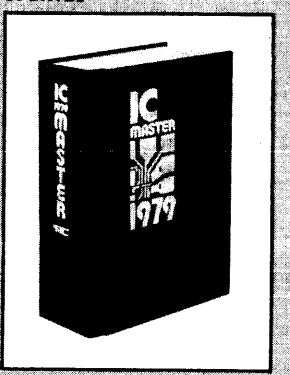
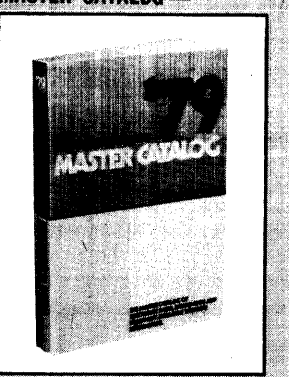
WE KNOW OUR STUFF



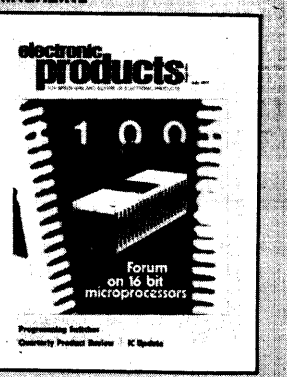
42 YEARS OF EXPERIENCE IN CATALOGING, 22 EDITIONS OF eem

eem/ELECTRONIC ENGINEERS MASTER CATALOG —



The "blue-ribbon" catalog/directory that has become "the standard of the industry" for electronic engineers, buyers and specifiers.

IC MASTER AND THE UPDATES —



The only complete single-source directory including all IC devices manufactured in the United States. Updated three times yearly with accumulative supplements.

ELECTRONIC DISTRIBUTORS MASTER CATALOG —

The only national catalog designed exclusively for distributors and their customers featuring electronic parts, instruments and equipment.

ELECTRONIC PRODUCTS MAGAZINE —

The products magazine . . . A 100% product-oriented magazine including hundreds of new products and special features every month.

eem FILE SYSTEM —

The only filing system designed especially for the electronics engineer. Instant retrieval and organization of data sheets and catalogs.

UTP CUSTOM CATALOGS —

The Cadillac of individualized catalogs for the electronic parts distributor, featuring solely his lines and services.

UNITED COST AND PRICING SERVICES —

The electronic distributors' proven method of being up to the minute on his cost and selling prices.

UTP United Technical Publications, Inc., Div. of Cox Broadcasting Corp. 645 Stewart Ave., Garden City, N.Y. 11530 / (516) 222-2500 TWX 510-222-1673

SL445A
POWER CONTROL
ZERO VOLTAGE SWITCH

The SL445 is a triac controller providing a *complete* solution for temperature controlled electric panel heaters, cookers, film processing baths etc.

Switching occurs at the zero voltage point in order to minimise radio frequency interference.

The device is suitable for on-line operation and requires minimal external components.

SPECIAL FEATURES

1. Choice of proportional or on/off temperature control.
2. Controlled switching rate in order to limit 'lamp flicker'. A pulse integration technique eliminates the problems associated with electrolytic timing capacitors.
3. Very accurate temperature control is possible since switching jitter has been eliminated *without introducing hysteresis* to the servo amplifier.
4. Symmetrical burst control i.e. no half-wave firing.
5. LED drive circuit which responds directly to the temperature setting.
6. Over-temperature protection circuit using a 'fail-safe' PTC thermistor and having the option of automatic or manual reset.
7. LED/Buzzer drive circuit controlled by 6 above.
8. High immunity against spurious triac trigger pulses under noisy mains environment.
9. Spurious triac trigger pulses inhibited at 'switch-on'.
10. Potentiometer expansion circuit to improve resolution/reduce component count.

ABSOLUTE MAXIMUM RATINGS

Pin	Max.	Units
1. Applied voltage	V_4	V
3. Peak Repetitive Current in ($\pm I_{2M}$)	80	mA
3. Non-repetitive peak current (tp $<$ 250μS) $\pm I_{2SM}$	200	mA
5. Applied voltage	10	V
6. Applied Voltage	10	V
6. Output Current	10	mA
7. Applied Voltage	6	V
7. Output Current	10	mA
8. Applied Voltage	10	V
9. Applied Voltage	V_{11}	V
10. Applied Voltage	V_{11}	V
11. Output Current	10	mA
16 Applied Voltage	V_4	V

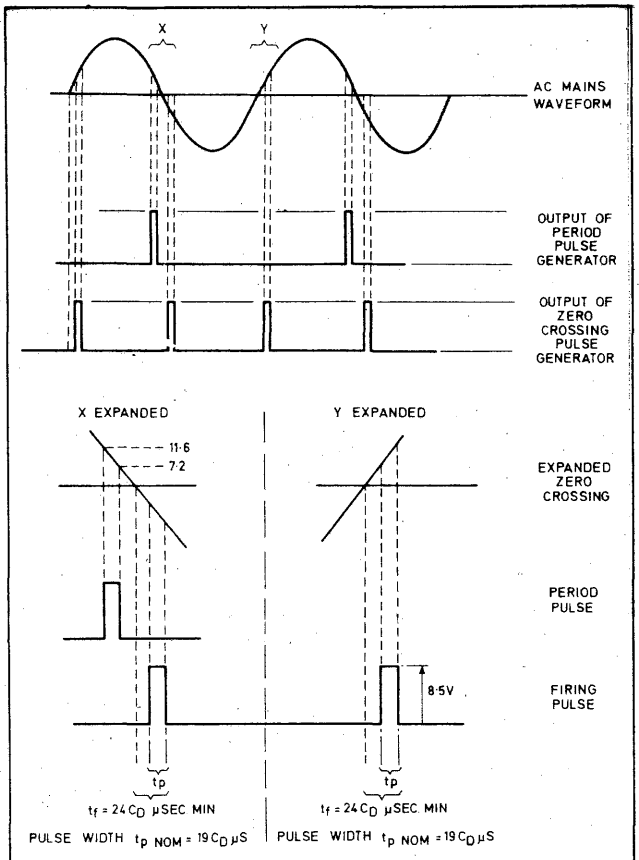

Fig. 6 Pulse timing

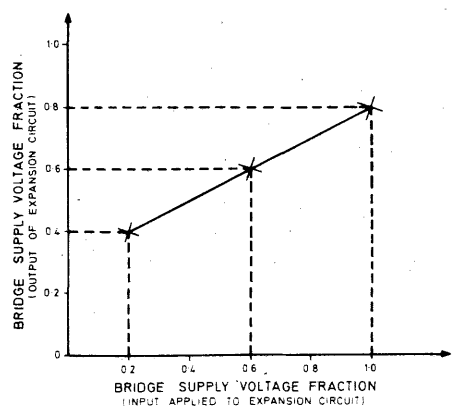

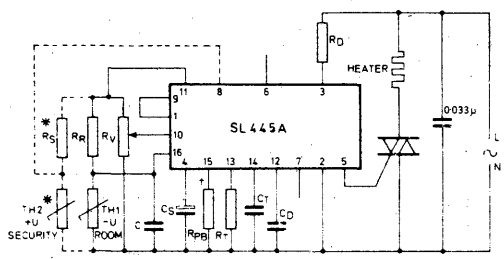

Fig. 7 Potentiometer expansion characteristic

* These two components may be omitted if the over-temperature trip facility is not required. Pin 8 should then be taken to common ie. Pin 2.

† This component may be omitted if proportional control is not required. The circuit will then provide times on/off control. Pin 15 should be taken to Pin 11.

C May be required to integrate input noise e.g. 47nF.

Fig. 8 Electric panel heater control with room thermostat and optional security thermostat

LED INDICATOR

Provides the following facilities

(a) In the case of timed proportional control, the LED will be lit continuously if any energy is supplied during the timing cycle, i.e. the LED will only be extinguished if the room temperature is being maintained without panel assistance.

(b) In the case of timed on/off control, the LED will be lit for the period that energy is being consumed, i.e. the LED will flash on and off as the room temperature varies about the set point.

(c) Room temperature may be ascertained by observing LED action whilst adjusting the temperature setting i.e. the LED is a substitute for the sound produced by electromechanical thermostats.

The LED facility may be added as shown in Fig. 9.

It is desirable to minimise LED drive current since this has a significant effect on the power rating of the mains dropping resistor R_D. If the LED is for facility 'a' or 'b', a high intensity, wide viewing angle LED will be required and a current of 5mA nominal is suggested i.e. $R_L = 1k\Omega$ ($V_{LED} = 1.5V$).

If the LED is only intended for facility 'c', a small, narrow viewing angle LED may be used and a current of 0.5mA nominal is sufficient i.e. $R_L = 10k\Omega$ ($V_{LED} = 1.5V$).

A small amount of positive feedback may be applied to the servo amplifier by inclusion of resistor Rf (Fig. 9b). This can ensure flicker free operation of the LED by increasing the immunity of the amplifier to noise etc. on its input connections. However, the level of feedback should be minimised since temperature regulation will necessarily be impaired. A typical value for Rf would be 4.7 MΩ and this results in a hysteresis of 13mV (0.13°C) if the bridge components are as given below.

SECURITY (OVERTEMPERATURE TRIP) INDICATION

Indication may be provided by LED or buzzer as shown in Fig. 10.

SECURITY (OVERTEMPERATURE TRIP) RESET

Hysteresis may be externally applied to the Inhibit Amplifier such that re-entry of the control circuit takes place automatically i.e.

©IC MASTER 1979

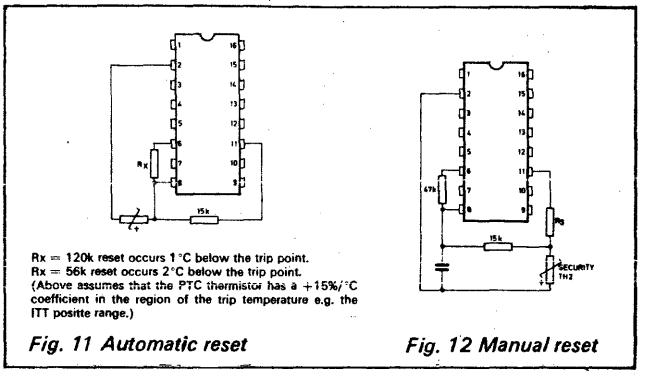
Fig. 10b Buzzer (6V, 6mA)

Fig. 10 Security indicator circuits

when the panel temperature falls to a certain level below the trip point. Alternatively, it may be arranged that the trip circuit—when activated—can only be reset by manual intervention e.g. momentarily interrupting the mains supply. It is desirable to introduce some hysteresis to the system when using a buzzer, in order to ensure positive on/off operation. When the manual reset mode of operation is adopted, an additional capacitor is required to eliminate the possibility of a spurious spike tripping the circuit.

COMPONENT VALUES



Room Temperature Sensing (R_R, TH1, R_V)

Rv = 22k or 25k linear control potentiometer.
R_R = 18k ±2%
THI = NTC thermistor, e.g. ITT type KQ223Y,
R_{25} = 22k ±10%, B = 4300 ±5%

Using these components, substantially linear temperature control is obtained over the range 5°C to 35°C. This range is covered by 69% of the potentiometer track when the I.C's expansion circuit is used as shown in figure 1. If the LED facility is used, calibration can be both accurate and rapid.

Controlled Switching rate (R_T, C_T)

The period of the ramp generator is dictated by the requirements of Cenelec EN50.006 concerning lamp flicker. The load can only be switched into circuit at the start of a ramp cycle i.e. if power is interrupted to the load at any point in the cycle, subsequent demands for power can only be met at the start of the next cycle.

Rx = 120k reset occurs 1°C below the trip point.
Rx = 56k reset occurs 2°C below the trip point.
(Above assumes that the PTC thermistor has a +15%/°C coefficient in the region of the trip temperature e.g. the ITT positte range.)

Fig. 11 Automatic reset

Fig. 12 Manual reset

The pulse integration technique employed in the ramp generator accounts for the mains voltage term in the formula:

Period of ramp = 0.2 x V_{RMS} x C_T seconds ± 10%

This assumes R_T = 100k. C_T is in μF, and V_{RMS} is in volts, e.g. a 1.0μF capacitor will provide a ramp period of 44 sec if the circuit is used with a 220V AC supply.

The capacitor should be of polyester or similar construction. Because of leakage and other considerations, electrolytic capacitors are not suitable.

Proportional Control (R_{PB})

Resistance R_{PB} controls the proportion of the ramp waveform which is applied internally to the offset facility of the servo amplifier. R_{PB} therefore, controls the width of the proportional control band.

If R_{PB} = 220k, the peak offset will be 100mV which is equivalent to a proportional control band of 1°C if the above bridge component values are used.

If R_{PB} = 100k, PB = 2.2°C
= 390k, PB = 0.55°C etc.

Overtemperature Control (Security) (Rs, TH2)

Rs = 15k

	Trip Temperature Min.	Max.
TH2 = ITT POSITTE PTC thermistor type YC080TB	82°C	90°C
=ITT POSITTE PTC thermistor type YC090TB	92°C	100°C
=ITT POSITTE PTC thermistor type YC100TB	102°C	110°C

Thermistors of alternative manufacture may be used although the value of R_S may then differ. Tripping takes place if the resistance of TH2 is greater than $R_S \div 8$.

The value of R_S should be kept high to minimise power loss in R_D.

Triac and C_D

Generally, the maximum gate firing voltage (V_{GT}) of a triac is 2.0V and the output stage of the IC has been designed to deliver a minimum of 80mA into such a load. The nominal current is 100mA and the triac is supplied with positive gate current. A wide range of suitable, low price triacs are available from several manufacturers. In order to minimise RFI, a triac should be chosen which has a low latching current IL. The triac cannot latch until the supply voltage V_L O (V_T + I_L x R_L) where

V_T = on-stage voltage of the device
R_L = resistance of the triac load

Therefore the triac requires a gate current

$$\frac{V_L \times 10^6}{V_{RMS} \times \sqrt{2} \times 2\pi f} \mu S$$

©IC MASTER 1979

after the zero crossing point in the supply cycle where f = the supply frequency.

e.g. for a 380V ±10%, 50HZ supply, 1kW load

MAX. V_T of triac = 1.2V (@ I_L)

MAX. I_L of triac = 50mA

we get $R_L = \frac{380^2}{10^3} = 144.4\Omega$

R_L MAX = 144.4 + 5% =152Ω

$V_L = I_L \times R_L + V_T = 0.05 \times 152 + 1.2 = 8.8V$ Max

The trailing edge of the firing pulse (Tf) must occur not sooner than

$\frac{V_L \times 10^6}{V_{RMS} \times \sqrt{2} \times 2nf}$ μs after the zero crossing point.

$Tf\ MIN. = \frac{8.8 \times 10^6}{0.9 \times 380 \times \sqrt{2} \times 2 \times \pi \times 50}$

$= 57.91\ \mu s = 24 \times C_D$

C_D MIN. = 57.91 = 2.41nf

C_D = 2.7 nF ±10%

The same triac could of course be used to control a higher power load. The load resistance and hence required V_L would fall, but for convenience the value of C_D need not be altered. Similarily, if the above calculations are repeated for a 220V supply, it will be established that C_D must exceed 1.77 nF and a value of 2.7 nF is again suitable. It may be convenient to use the same triac and value of C_D for 220, 240 and 380V applications. However, C_D should be kept as low as possible if power dissipation in the dropper resistor is to be minimised.

LINE DROPPING RESISTOR (R_D)

Table I indicates the value of resistor R_D as a function of mains supply voltage, facilities provided etc. It will be apparent that it is desirable when dealing with a 380V supply to reduce power dissipation in the dropper resistor by introducing a series diode.

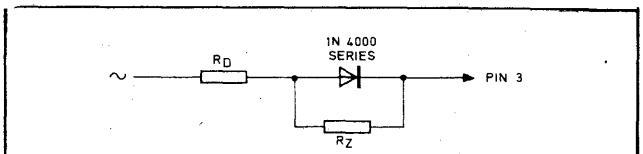


Fig. 13 Mains supply input circuit

	110V	220/240V	380V
R_Z ±10%	39k	82k	82k
Power dissipation in R_Z (max)	0.3W	0.4W	1W
Minimum value C_D	2.4 nf	1.9 nF	1.3 nF

Table 2 Max. value of R_Z for various supply voltages

The diode bypass resistor R_Z (see Table 2) is necessary to provide proper operation of the zero voltage crossing circuit. The values for R_D given in the table may be reduced for rationalization purposes if required (e.g. common value for 220/240V supplies) or where additional external circuitry is fed by the 8.3V or 14V supplies. This may necessitate an appropriate increase in the value of the smoothing capacitor Cs. Furthermore, consideration should be given to the possible increase in chip power dissipation particularly if the external load is dynamic.

SMOOTHING CAPACITOR (Cs)

A 220μF 16V Capacitor should be used except when dealing with the higher current appications i.e. 5mA LED, 6mA buzzer etc. Cs should then be increased to 330μF. The ripple voltage should be kept below 1V peak–to–peak.

Facilities used					Nominal R_D value (±5%)	Maximum R_D power dissipation	Maximum R_D power dissipation (with diode)	Nominal power supply voltage ±10%	Nominal C_D

DESCRIPTION

The RC4151 and RM4151 provide a simple low-cost method of analog-to-digital conversion. They have all the inherent advantages of the voltage-to-frequency conversion technique. The output of the 4151 is a series of pulses of constant duration. The frequency of the pulses is proportional to the applied input voltage. These converters are designed for use in a wide range of data conversion and remote sensing applications.

FEATURES

- Single supply operation (+8V to +22V)
- Pulse output compatible with all logic forms
- Programmable scale factor (K)
- Linearity ±0.05% typical - precision mode
- Temperature stability ±100% ppm/°C typical
- High noise rejection
- Inherent monotonicity
- Easily transmittable output
- Simple full scale trim
- Single-ended input, referenced to ground
- Also provides frequency-to-voltage conversion

DESCRIPTION

The Raytheon 4152 consists of a comparator, a one-shot, a precise gated current-source output, an internal voltage reference, and an open-collector output . . . all on a single monolithic IC chip. These elements can be combined via external pin connections to perform a wide variety of circuit functions.

The versatility of this unique IC makes it easy to tailor the circuit operation to your needs. Pulse width, scale factor, and output drive are set by external resistors as shown in Figure 1. Combine the versatile 4152 with an op amp or two, some digital circuits, and the range of cost-effective applications becomes even greater.

The Raytheon 4152 provides a versatile, low-cost means of accurately converting an analog signal to a pulse train of proportional frequency, and vice versa. It can be imaginatively applied to a broad range of signal conditioning applications once the various functional blocks within the IC are understood.

The 4152 is directly interchangeable with the 4151, thereby allowing an upgrading of system accuracy at minimal cost.

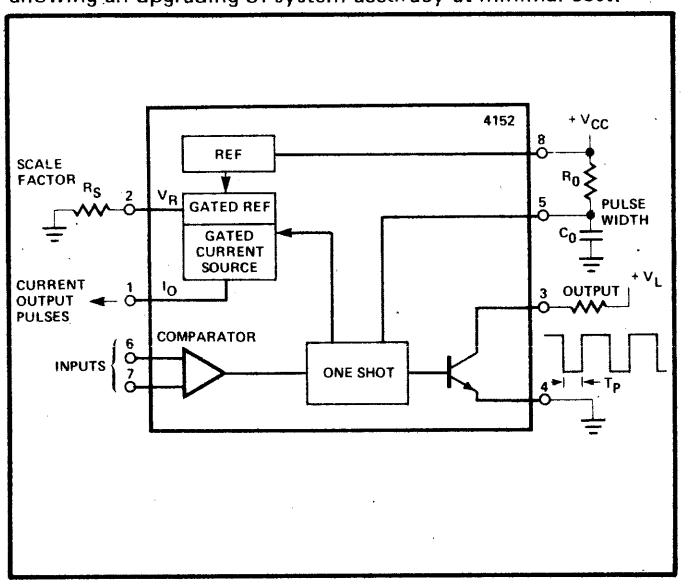

Figure 1. Functional Diagram of Raytheon 4152.

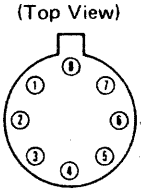
FEATURES



- Single supply operation (+7 V to +18 V)
- Pulse output compatible with all logic forms (DTL/TTL/CMOS)
- Programmable scale factor (K)
- High linearity ±0.05% max
- Temperature stability ±150 ppm/°C max
- Direct replacement for RM/RC4151
- High noise rejection
- Inherent monotonicity
- Easily transmittable output
- Simple full scale trim
- Single-ended input, referenced to ground
- V/F or F/V conversion
- Voltage or current input
- Wide dynamic range

APPLICATIONS

- Precision voltage-to-frequency-converters
- Pulse-width modulators
- Programmable pulse generators
- Frequency-to-voltage converters
- Integrating analog-to-digital converter
- Long-term analog integrator
- Signal conversion –
  - Current-to-frequency
  - Temperature-to-frequency
  - Pressure-to-frequency
  - Capacitance-to-frequency
  - Frequency-to-current
- Signal isolation
  - VFC → opto-isolation → FVC
  - ADC with opto-isolation
- Signal encoding
  - FSK modulation/demodulation
  - Pulse-width modulation
- Frequency scaling
- DC motor speed control

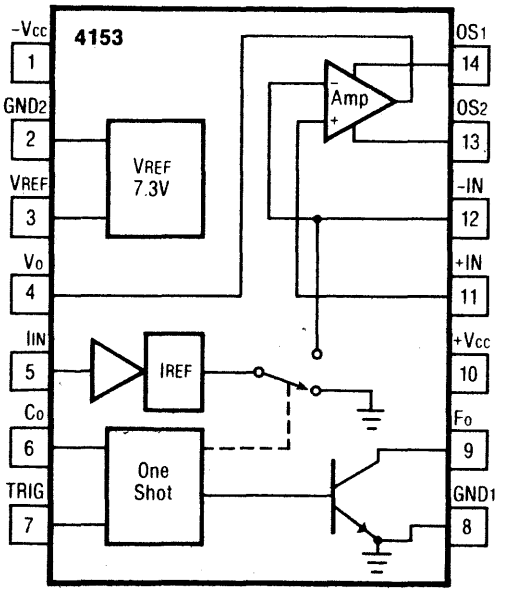
Description

The 4153 is a high speed, precision voltage-to-frequency converter utilizing Linear LSI technology to provide a fully contained 12 bit accurate data conversion element.

The 4153 converts an analog input signal to a proportional serial pulse train output with scaling selectable over a wide dynamic range (>100dB). Comparable performance is available in the frequency-to-voltage mode making the 4153 an ideal building block for accurate, wide bandwidth isolation amplifiers and 3-wire analog data links.

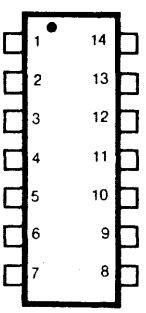
The speed, accuracy and temperature performance of the 4153 is achieved by incorporating on a single monolithic chip high speed ECL logic, a high gain, wide bandwidth op amp and an ion-implanted buried zener reference.



Features

- < .1Hz to > 250KHz dynamic range
- .01% F.S. max. nonlinearity error (.1Hz to 10KHz)
- 150ppm/° C max. gain tempco
- On board 7.3 volt reference

Applications



- Precision voltage-to-frequency-converters
- Pulse-width modulators
- Programmable pulse generators
- Frequency-to-voltage converters
- Integrating analog-to-digital converter
- Long-term analog integrator
- Signal Conversion—
  - Current-to-frequency

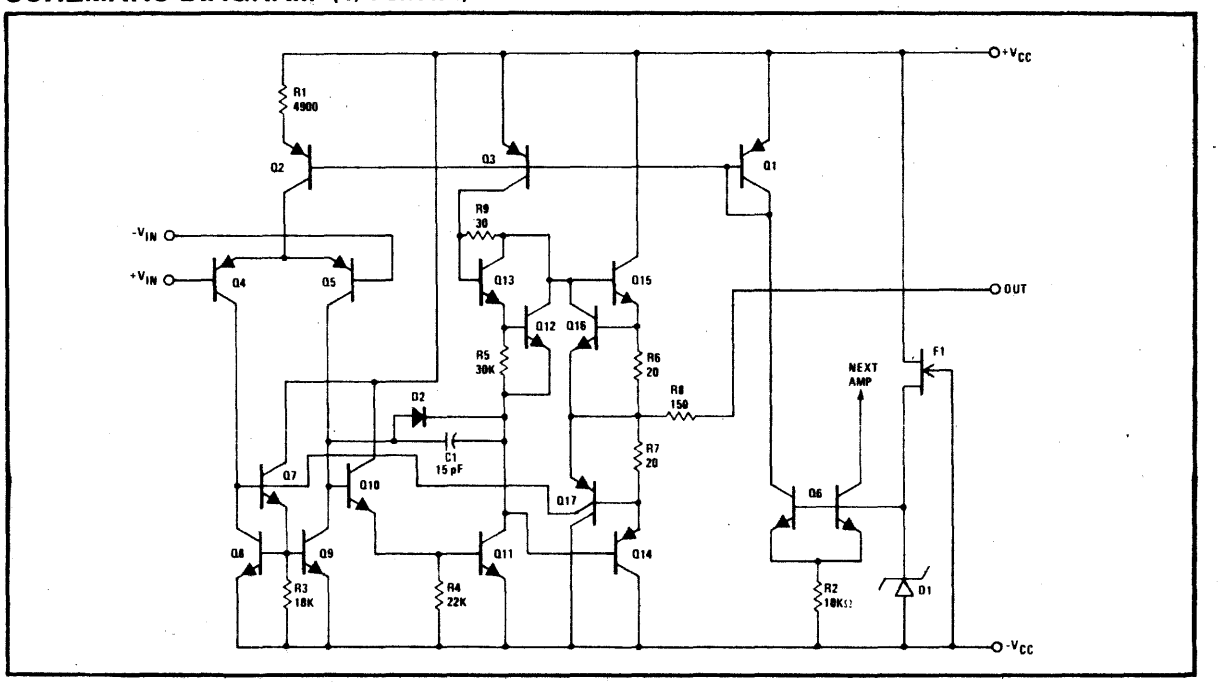
Quad High Performance Operational Amplifier

DESCRIPTION

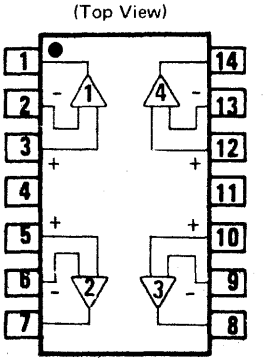
The RM4156/RC4156 is a monolithic integrated circuit, consisting of four independent high performance operational amplifiers constructed with the planar epitaxial process.



These amplifiers feature guaranteed A.C. performance which far exceeds that of the 741 type amplifiers. Also featured are excellent input characteristics and guaranteed low noise making this device the optimum choice for audio, active filter and instrumentation applications.

FEATURES

	Typical	Guaranteed
• Unity Gain Bandwidth	3.5 MHz	2.8 MHz
• High Slew Rate	1.6V/μS	1.3V/μS
• Low Noise Voltage	1.4μV	2.0μV



- Indefinite Short Circuit Protection
- No Crossover Distortion
- Low Input Offset and Bias Parameters
- Internal Compensation

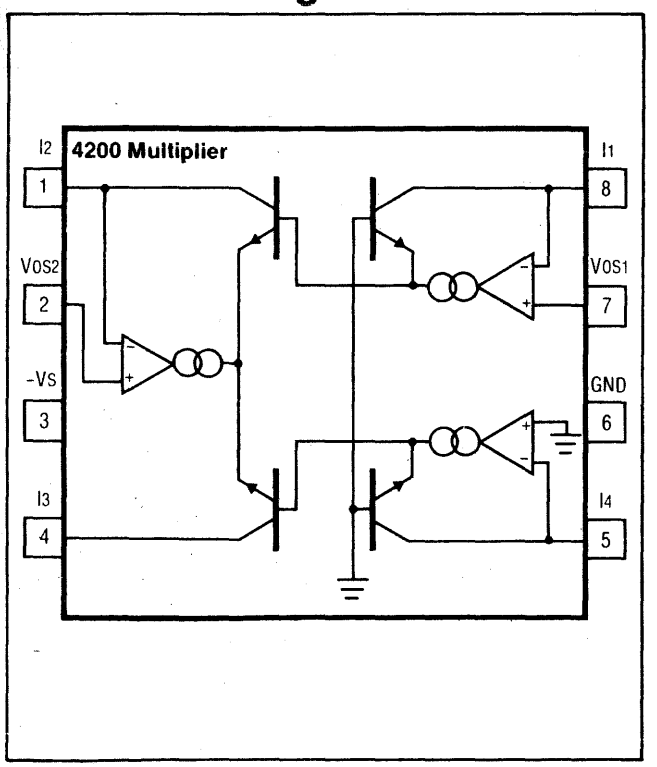
Notes: 1. Rating applies for case temperature of +25°C maximum; derate linearity at 6.4 mW/°C for temperatures above +25°C.
2. For supply voltages less than ±15V, the absolute maximum input voltage is equal to the supply voltage.
3. Short circuit to ground on one amplifier only.

©IC MASTER 1979

General Description

The Raytheon RC4200 is the industry's first integrated circuit multiplier to have complete compensation for non-linearity, the primary source of error and distortion. This is also the first IC multiplier to have three on-board operational amplifiers designed specifically for use in multiplier logging circuits. These specially-designed amplifiers are frequency compensated for optimum AC response in a logging circuit; the heart of a multiplier, and can therefore provide superior AC response in comparison to other analog multipliers.

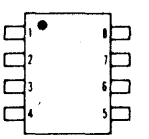
Versatility is unprecedented; this is the first IC multiplier that can be used in a wide variety of applications without sacrificing accuracy. Four-quadrant multiplication, two-quadrant division, square-rooting, squaring and RMS conversion can all be easily implemented with predictable accuracy. The nonlinearity compensation is not just trimmed at a single temperature, it is designed to provide compensation over the full temperature range. This nonlinearity compensation combined with the low gain and offset drift inherent in a well-designed monolithic chip provides a very low accuracy tempco.



Design Features

- High accuracy
  Non-linearity—0.1% maximum
  Temperature coefficient—0.005%/°C maximum
- Multiple functions
  Multiply, divide, square, square root, RMS-to-DC conversion, AGC, and modulate/demodulate
- Wide bandwidth—4 MHz
- Feedthru Rejection 60dB @ 100 KHz
- Signal-to-noise ratio 94dB

The excellent linearity and versatility were achieved through circuit design rather than special grading to tweaking, therefore unit cost is very low. Analog multipliers can now be used in applications where price was previously an inhibiting factor.



The Raytheon RC4200 is ideal for use in low-distortion audio modulation circuits, voltage-controlled active filters, and precision oscillators.

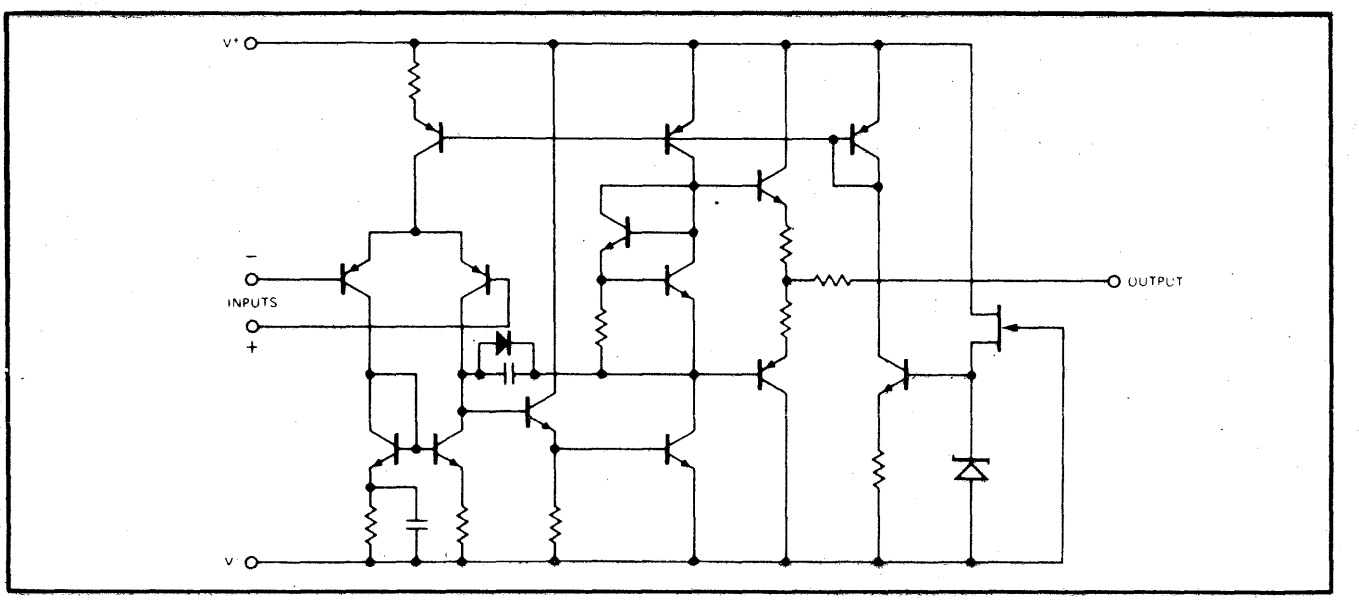
Notes: 1. Refer to sec. E and sec. G for input current limitations.
2. Refer to Figure 6 for example.
3. These specifications apply with output (I3) connected to an op amp summing junction. If desired, the output (I3) at pin (4) can be used to drive a resistive load directly. The resistive load should be less than 700 ohms and must be pulled up to a positive supply such that the voltage on pin (3) stays within a range of 0 to +5V.

©IC MASTER 1979

GENERAL DESCRIPTION

The 4559 integrated circuit is a dual high performance operational amplifier internally compensated and constructed on a single silicon chip using the planar epitaxial process.

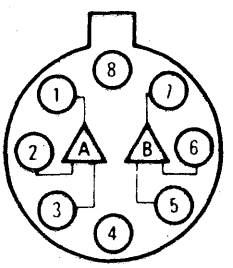
These amplifiers feature guaranteed AC performance which far exceeds that of the 741-type amplifiers. The specially designed low-noise input transistors allow the 4559 to be used in low-noise signal processing applications such as audio pre amplifiers and signal conditioners.



The 4559 also has more output drive than 741-type amplifiers and can be used to drive a 600 ohm load.

FEATURES

	Typical	Guaranteed
• Unity Gain Bandwidth	4.0 MHz	3.0 MHz
• Slew Rate	2.0 V/μsec	1.5 V/μsec
• Low Noise Voltage	1.4 μV_{RMS}	2.0 μV_{RMS}



- Supply Voltage ±22V for RM4559 and ±18V for RC4559
- No Frequency Compensation Required
- No Latch Up
- Large Common Mode and Differential Voltage Ranges
- Low Power Consumption
- Parametric Tracking Over Temperature Range
- Gain and Phase Match Between Amplifiers

MATCHING CHARACTERISTICS (V_{CC} = ±15V, T_A = 25°C unless otherwise specified)

PARAMETER	CONDITIONS	RM4559 TYP	RC4559 TYP	UNITS
Voltage Gain	$R_L \geq 2k\Omega$	±0.5	±1.0	dB
Input Bias Current		±15	±15	nA
Input Offset Current		±7.5	±7.5	nA
Input Offset Voltage	$R_S \geq 10k\Omega$	±0.1	±0.2	mV

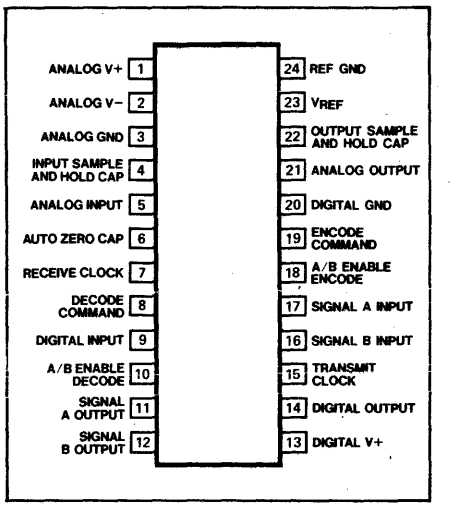
NOTES:
1. Rating applies for case temperatures to 125° C; derate linearly at 6.5mW/° C for ambient temperatures above ×75° C for RM4559
2. For supply voltages less than -15V, the absolute maximum input voltage is equal to the supply voltage.
3. Short circuit may be to ground on one amp only. Rating applies to +125° C case temperature or +75° C ambient temperature for RC4559 and to +85° C ambient temperature for RV4559.

RAYTHEON

©IC MASTER 1979

DESCRIPTION

The ST100 is a monolithic μ-255 law companded PCM Codec. This is a per channel device fabricated in I^2L technology. The ST100 has all the circuitry necessary to convert an analog signal into an 8 bit PCM digital data stream and vice versa. Asynchronous operation of transmit and receive is possible. A & B signaling and zero code suppression are also provided. Very few external components are required for its operation. The digital inputs are TTL compatible while the digital outputs are open collector, TTL compatible.



FEATURES

- **μ-255 law companding**
- **Serial data rates up to 2.048MHz**
- **Sampling rates up to 16kHz**
- **Asynchronous operation of transmit and receive**
- **A & B dual channel signaling**
- **Zero code suppression**
- **Low noise**
- **Fabricated with proven, reliable bipolar process**

APPLICATIONS

- **PCM channel banks**
- **EPABX'S**
- **Subscriber loop carrier systems**
- **Central office switches**

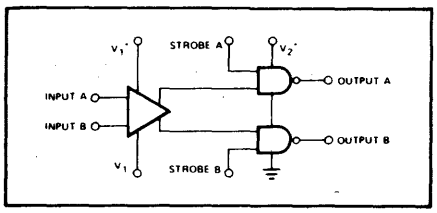
NE/SE527-F,K,N

DESCRIPTION

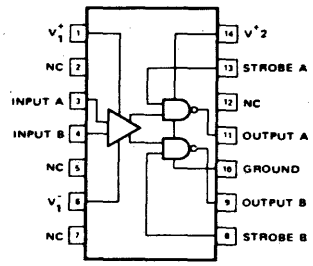
The SE/NE527 is a high speed analog voltage comparator which, in the first time mates state-of-the-art Schottky diode technology with the conventional linear process. This allows simultaneous fabrication of high speed T²L gates with a precision linear amplifier on a single monolithic chip. The SE/NE527 is similar in design to the Signetics SE/NE529 voltage comparator except that it incorporates a "Emitter Follower" input stage for extremely low input currents. This opens the door to a whole new range of applications for analog voltage comparators.



FEATURES

- **15ns propagation delay**
- **Complementary output gates**
- **TTL or ECL compatible outputs**
- **Wide common mode and differential voltage range**
- **Mil std 883A,B,C available**

APPLICATIONS



- **A/D conversion**
- **ECL to TTL interface**
- **TTL to ECL interface**
- **Memory sensing**
- **Optical data coupling**

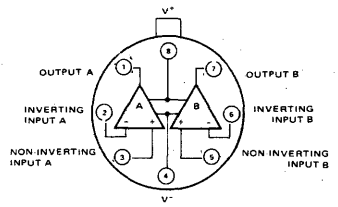
NE/SE532/532A/SA532-N,T

DESCRIPTION

The 532 consists of two independent, high gain, internally frequency compensated operational amplifiers designed specifically to operate from a single power supply over a wide range of voltages. Operation from dual power supplies is also possible and the low power supply current drain is independent of the magnitude of the power supply voltage.

FEATURES



- **Internally frequency compensated for unity gain**
- **Large dc voltage gain—(100dB)**
- **Wide bandwidth (unity gain)—1MHz (temperature compensated)**
- **Wide power supply range**
  single supply—(3Vdc to 30Vdc)
  or dual supplies—(±1.5Vdc to ±15Vdc)
- **Very low supply current drain (400μA)—essentially independent of supply voltage (1mW/op amp at +5Vdc)**
- **Low input biasing current—(45nA dc temperature compensated)**
- **Low input offset voltage—(2mVdc) and offset current—(5nA dc)**
- **Differential input voltage range equal to the power supply voltage**
- **Large output voltage—(0Vdc to V+—-1.5Vdc swing)**
- **SE532 Mil std 883A,B,C available**

UNIQUE FEATURES

In the linear mode the input common-mode voltage range includes ground and the output voltage can also swing to ground, even though operated from only a single power supply voltage. The unity gain cross frequency is temperature compensated. The input bias current is also temperature compensated.

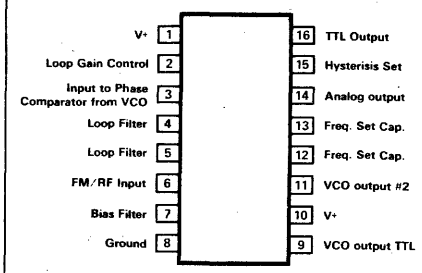
NE564-N

DESCRIPTION

The NE564 is a versatile, high frequency Phase Locked Loop designed for operation up to 50MHz. As shown in the block diagram, the NE564 consists of a VCO, limiter, phase comparator, and post detection processor.

APPLICATIONS



- **High speed modems**
- **FSK receivers and transmitters**
- **Frequency synthesizers**
- **Signal generators**

FEATURES

- **Operation with single 5V supply**
- **TTL compatible inputs and outputs**
- **Operation to 50MHz**
- **External loop gain control**
- **Reduced carrier feedthrough**
- **No elaborate filtering needed in FSK applications**
- **Can be used as a modulator**
- **Variable loop gain (Externally Controlled)**

BLOCK DIAGRAM

FUNCTIONAL DESCRIPTION

The NE564 is a monolithic phase locked loop with a post detection processor. The use of Schottky clamped transistors and optimized device geometries extends the frequency of operation to 50MHz. In addition to the classical PLL applications, the NE564 can be used as a modulator with a controllable frequency deviation.

The output voltage of the PLL can be written as shown in the following equation:

Equation 1

$$v_o = \frac{(f_{in} - f_o)}{K_{VCO}}$$

K_{VCO} = conversion gain of the VCO (see figure 7)
f_{in} = frequency of the input signal
f_o = free running frequency of the VCO

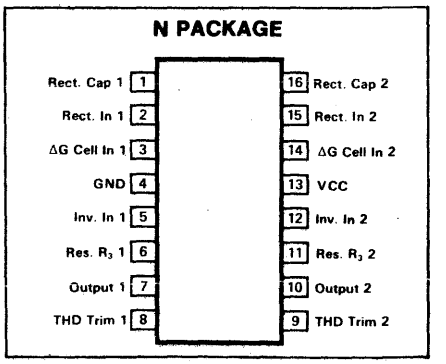
The process of recovering FSK signals involves the conversion of the PLL output into logic compatible signals.

©IC MASTER 1979

DESCRIPTION

The 570/571 is a versatile low cost dual gain control circuit in which either channel may be used as a dynamic range compressor or expandor. Each channel has a full wave rectifier to detect the average value of the signal; a linerarized, temperature compensated variable gain cell; and an operational amplifier.

The 570/571 is well suited for use in telephone subscriber and trunk carrier systems, communications systems and hi-fi audio systems.



FEATURES

- **Complete compressor and expandor in 1 IC**
- **Temperature compensated**
- **Greater than 110dB dynamic range**
- **Operates down to 6Vdc**
- **System levels adjustable with external components**
- **Distortion may be trimmed out**

APPLICATIONS

- **Telephone trunk compandor—570**
- **Telephone subscriber compandor—571**
- **High level limiter**
- **Low level expandor—noise gate**
- **Dynamic noise reduction systems**
- **Voltage controlled amplifier**
- **Dynamic filters**

BLOCK DIAGRAM

CIRCUIT DESCRIPTION

The 570/571 compandor building blocks, as shown in the block diagram, are a full wave rectifier, a variable gain cell, an operational amplifier and a bias system. The arrangement of these blocks in the IC result in a circuit which can perform well with few external components, yet can be adapted to many diverse applications.

The full wave rectifier rectifies the input current which flows from the rectifier input, to an internal summing node which is biased at V_{REF}. The rectified current is averaged on an external filter capacitor tied to the C_{RECT} terminal, and the average value of the input current controls the gain of the variable gain cell. The gain will thus be proportional to the average value of the input signal for capacitively coupled voltage inputs as shown in the following equation. Note that for capacitively coupled inputs there is no offset voltage capable of producing a gain error. The only error will come from the bias current of the rectifier (supplied internally) which is less than .1μA.

$$G \propto \frac{|V_{IN} - V_{REF}|_{ave}}{R_1}$$

or

$$G \propto \frac{|V_{IN}|_{ave}}{R_1}$$

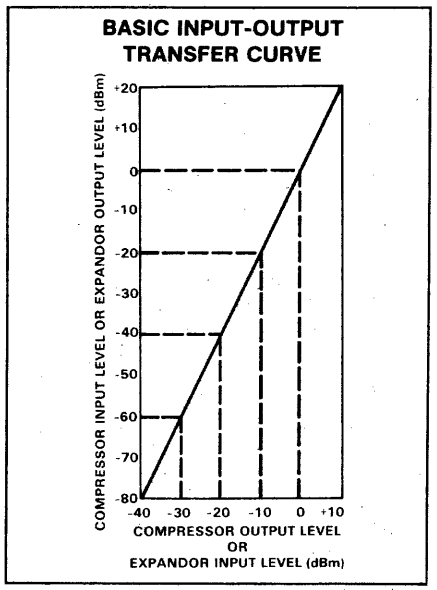
The speed with which gain changes to follow changes in input signal levels is determined by the rectifier filter capacitor. A small capacitor will yield rapid response but will not fully filter low frequency signals. Any ripple on the gain control signal will modulate the signal passing through the variable gain cell. In an expandor or compressor application, this would lead to third harmonic distortion, so there is a tradeoff to be made between fast attack and decay times, and distortion. For step changes in amplitude, the change in gain with time is shown by this equation.

$$G(t) = (G_{initial} - G_{final})\ e^{-t/\tau} + G_{final};\ \tau = 10K \times C_{RECT}$$

The variable gain cell is a current in, current out device with the ratio I_{OUT}/I_{IN} controlled by the rectifier. I_{IN} is the current which flows from the ΔG input to an internal summing node biased at V_{REF}. The following equation applies for capacitively coupled inputs. The output current, I_{OUT}, is fed to the summing node of the op amp.

$$I_{IN} = \frac{V_{IN} - V_{REF}}{R_2} = \frac{V_{IN}}{R_2}$$

A compensation scheme built into the ΔG cell compensates for temperature, and cancels out odd harmonic distortion. The only distortion which remains is even harmonics, and they exist only because of internal offset voltages. The THD trim terminal provides a means for nulling the internal offsets for low distortion operation.



The operational amplifier (which is internally compensated) has the non-inverting input tied to V_{REF}, and the inverting input connected to the ΔG cell output as well as brought out externally. A resistor, R_3, is brought out from the summing node and allows compressor or expandor gain to be determined only by internal components. The output stage is capable of ±20mA output current. This allows a +13dBm (3.5V rms) output into a 300Ω load which, with a series resistor and proper transformer, can result in +13dBm with a 600Ω output impedance.

©IC MASTER 1979

A band gap reference provides the reference voltage for all summing nodes, a regulated supply voltage for the rectifier and ΔG cell, and a bias current for the ΔG cell. The low tempco of this type of reference provides very stable biasing over a wide temperature range.

The typical performance characteristics illustration shows the basic input-output transfer curve for basic compressor or expandor circuits.

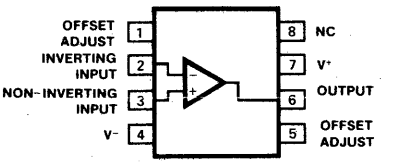
DESCRIPTION



The 530/5530 are new generation operational amplifiers featuring high slew rates combined with improved input characteristics. Internally compensated, the SE530/5530 guarantee slew rates of 25V/μs with 2mV maximum offset voltage. Industry standard pinout and internal compensation allow the user to upgrade system performance by directly replacing general purpose amplifiers such as the 741, 747, 1458, 4558 and LF356 types.

FEATURES

- **Gain bandwidth product—3MHz**
- **35V/μs slew rate (Gain = -1)**
- **Internal frequency compensation**
- **Low input offset voltage 2mV max**
- **Low input bias current-60nA max**
- **Short circuit protection**
- **Offset null capability**
- **Large common mode and differential voltage ranges**

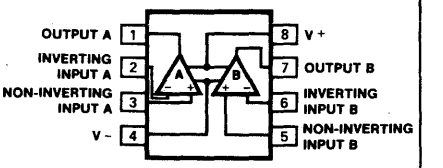
NE5532/5532A-FE,T

DESCRIPTION

The NE5532 is a dual high-performance low noise operational amplifier. Compared to most of the standard operational amplifiers, such as the 1458, it shows better noise performance, improved output drive capability and considerably higher small-signal and power bandwidths.



This makes the device especially suitable for application in high quality and professional audio equipment, instrumentation and control circuits, and telephone channel amplifiers. The op amp is internally compensated for gains equal to one. If very low noise is of prime importance, it is recommended that the NE5532A version be used which has guaranteed noise specifications.

FEATURES

- **Small-signal bandwidth: 10MHz**
- **Output drive capability: 600Ω, 10V (rms)**
- **Input noise voltage: 5nV/√Hz**
- **DC voltage gain: 50000**
- **AC voltage gain: 2200 at 10kHz**
- **Power bandwidth: 140kHz**
- **Slew-rate: 9V/μs**
- **Large supply voltage range: ±3 to ±20V**
- **Pin out 5532**

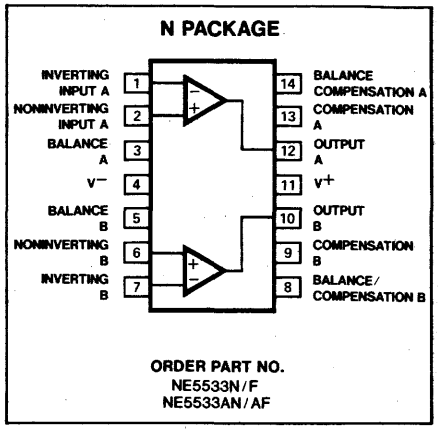
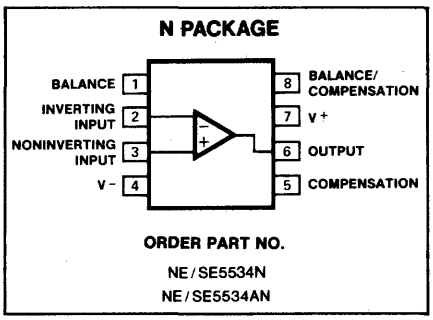
NE/5533/5533A-N,F•NE/SE5534/5534A-N,T

DESCRIPTION

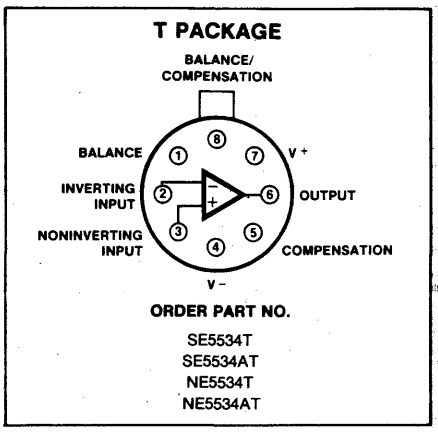
The 5533/5534 are single and dual high-performance low noise operational amplifiers. Compared to other operational amplifiers, such as TL083, they show better noise performance, improved output drive capability and considerably higher small-signal and power bandwidths.



This makes the devices especially suitable for application in high quality and professional audio equipment, in instrumentation and control circuits and telephone channel amplifiers. The op amps are internally compensated for gain equal to, or higher than, three. The frequency response can be optimized with an external compensation capacitor for various applications (unity gain amplifier, capacitive load, slew-rate, low overshoot, etc.) If very low noise is of prime importance, it is recommended that the 5533A/5534A version be used which has guaranteed noise specifications.



FEATURES



- **Small-signal bandwidth: 10MHz**
- **Output drive capability: 600Ω, 10V (rms) at $V_S = \pm 18V$**
- **Input noise voltage: 4nV/$\sqrt{Hz}$**
- **DC voltage gain: 100000**
- **AC voltage gain: 6000 at 10kHz**
- **Power bandwidth: 200kHz**
- **Slew-rate: 13V/μs**
- **Large supply voltage range: ±3 to ±20V**

NOTES

1. Diodes protect the inputs against over-voltage. Therefore, unless current-limiting resistors are used, large currents will flow if the differential input voltage exceeds 0.6V. Maximum current should be limited to ±10mA.
2. For operation at elevated temperature T package must be derated based on a thermal resistance of 150°C/W junction to ambient, 45°C/W junction to case. Thermal resistance of the N package is 240°C/W junction to ambient.
3. Output may be shorted to ground at $V_S = \pm 15V$, $T_A = 25°C$. Temperature and/or supply voltages must be limited to ensure dissipation rating is not exceeded.

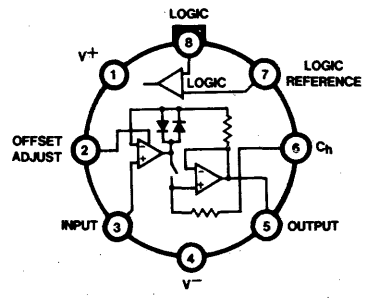
DESCRIPTION

The NE5537 monolithic Sample and Hold amplifier combines the best features of ion implanted JFET's with bipolar devices to obtain high accuracy, fast acquisition time, and low droop rate. This device is pin compatible with the LF198, and features a superior performance in droop rate and output drive capability. The circuit, shown in Figure 1 contains two operational amplifiers which function as a unity gain amplifier in the sample mode. The first amplifier has bipolar input transistors which gives the system a low offset voltage. The second amplifier has JFET input transistors to achieve low leakage current from the hold capacitor. A unique circuit design for leakage current cancellation using current mirrors gives the NE5537 a low droop rate at higher temperature. The output stage has the capability to drive a 2K load. The logic input is compatible with TTL, PMOS or CMOS logic. The differential logic threshold is 1.4V with the sample mode occurring where the logic input is high.



FEATURES

- **Operates from ±5V to ±18V supplies**
- **Hold leakage current 6pA @ T_j25°C**
- **Less than 10μs acquisition time**
- **TTL, PMOS, CMOS compatible logic input**
- **0.5mV typical hold step at C_h = 0.01μF**
- **Low input offset: 1MV (typical)**
- **0.002% gain accuracy with R_L = 2kΩ**
- **Low output noise in hold mode**
- **Input characteristics do not change during hold mode**
- **High supply rejection ratio in sample or hold**
- **Wide bandwidth**

Logic inputs on the 5537 are fully differential with low input current, allowing direct connection to TTL, PMOS, and CMOS. Differential threshold is 1.4V. The 5537 will operate from ±5V to ±18V supplies. It is available in an 8-lead TO-5 package.

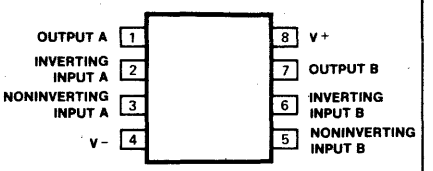
DESCRIPTION



The 538/5538 are new generation operational amplifiers featuring high slew rates combined with improved input characteristics. Internally compensated for gains of 5 or larger, the SE538/SE5538 offer guaranteed minimum slew rates of 40V/μs or larger. Featuring 2mV max input offset voltage, the 538 is a single amplifier while the 5538 is a dual version. Industry standard pin out and internal compensation allow the user to upgrade system performance by directly replacing general purpose amplifiers, such as 748, 101A, 741, 747 and 1458.

FEATURES

- **2mV max input offset voltage**
- **60nA max input offset current**
- **Short circuit protected**
- **Offset null capability**
- **Large common mode and differential voltage ranges**
- **60V/μs slew rate (gain of +5, -4 min)**
- **6MHz gain bandwidth product (gain +5, -4 minimum)**
- **Internal frequency compensation (gain of +5, -4 minimum)**
- **Pin out: 538 same as 741 (single)**
  5538 same as 747, 1458 (dual)

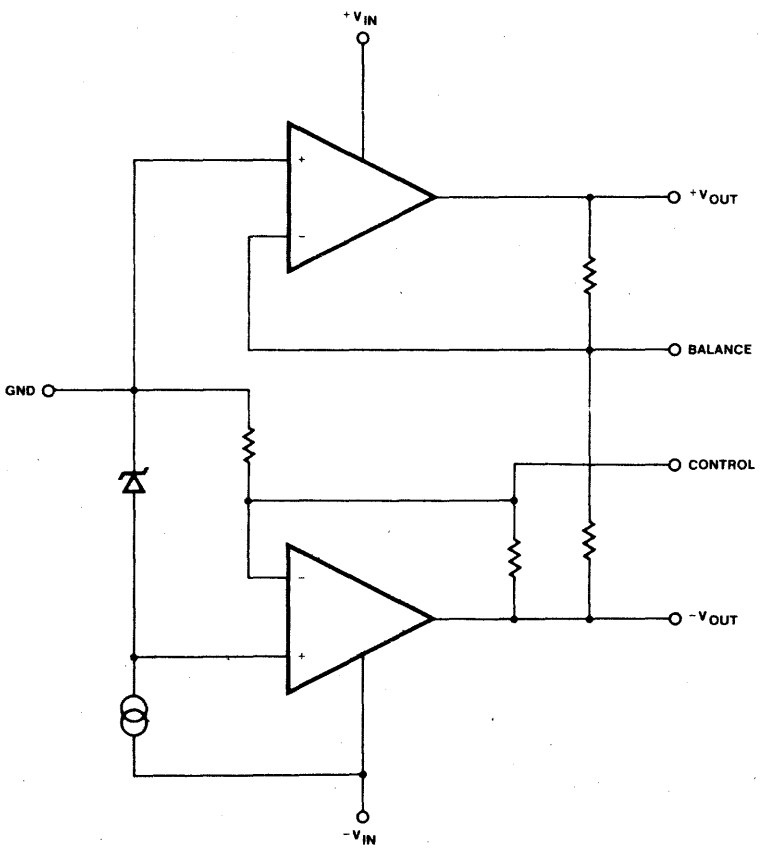
OBJECTIVE SPECIFICATION NE/SE5551/2/3/4/5-N,T

DESCRIPTION

The NE/SE5551, 2, 3, 4, 5 are dual polarity tracking regulators designed to produce balanced or unbalanced output voltages from 5 to 20 volts with up to 300 mA output current. Similar in specifications to the 78MXX and 79MXX fixed regulators, the 5551 series can be continuously adjusted, balanced or unbalanced. Standard fixed voltages available are ±5, ±6, ±12, ±15, and +5, -12 volts. Employing current limiting and thermal shutdown protection, these dual polarity regulators are ideal for local on-card regulation.



FEATURES

- **Output current to 300mA**
- **Internally current limited**
- **Thermal overload protected**
- **Input voltage to ±32V**
- **Output balance 1% typ.**
- **External balance control**
- **Continuously adjustable from 5 to 20 volts, balanced or unbalanced**
- **No external components required**
- **Short circuit current 400mA**
- **Heat sink available for increased power dissipation**

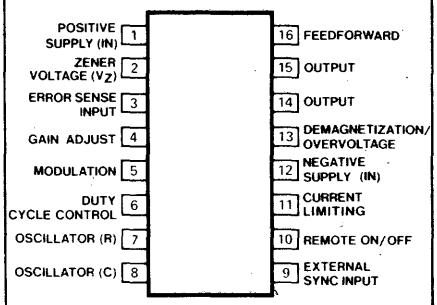
DESCRIPTION



The NE/SE5560 is a control circuit for use in switched mode power supplies. This single monolithic chip incorporates all the control and housekeeping (protection) functions required in switched mode power supplies, including an internal temperature compensated reference source, internal Zener reference, sawtooth generator, pulse width modulator, output stage and various protection circuits.

FEATURES

- **Stabilized power supply**
- **Temperature compensated reference source**
- **Sawtooth generator**
- **Pulse width modulator**
- **Remote on/off switching**
- **Current limiting**
- **Low supply voltage protection**
- **Loop fault protection**
- **Demagnetization/overvoltage protection**
- **Maximum duty cycle adjustment**
- **Feed forward control**
- **External synchronization**

DESCRIPTION

This LSI integrated circuit performs the digital control functions required for generating AM/FM radio frequency local oscillator signals using digital phase locked loop techniques. By the use of low power Schottky and ECL technologies on the same substrate it is possible to operate at 80MHz input frequencies with an average system power of 1.6mW per gate typical.

FEATURES

- **80MHz input frequency**
- **ECL prescaler**
- **LS process**
- **Single 5V supply**
- **Power dissipation—600mW (max)**
- **External components—**
  - **1 crystal**
  - **2 capacitors**

PHASE LOCKED LOOP BLOCK DIAGRAM

PHASE LOCKED LOOP PRINCIPLES

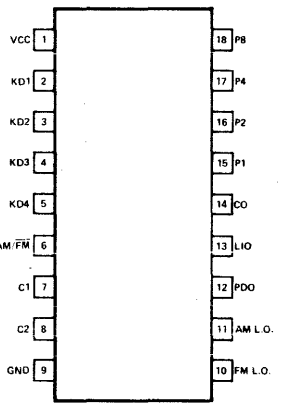
Digital phase locked loops are comprised of 4 basic building blocks: A fixed reference frequency generator (crystal oscillator and divider), a phase comparator, a voltage controlled oscillator (VCO) and a programable counter (÷N).

In cases where very high frequencies must be generated, a fixed prescaler (÷M) is employed to divide the local oscillator frequency down to a frequency compatible with the programmable counter. Fout from the VCO is divided down by the prescaler and programmable counters and compared to the reference frequency by the phase detector. If $\frac{Fout}{MN}$ is not equal to Fref in phase and frequency, the phase detector generates a signal which causes the VCO frequency to increase or decrease until Fref = $\frac{Fout}{MN}$. When this occurs, the local oscillator is essentially as stable as the crystal reference oscillator.

The local oscillator frequency (Fout) is changed by programming a different number into the programmable counter. The distance between discrete frequencies or the channel spacing is determined by the reference frequency.

For the AM/FM circuit, up to 200 channels are possible with selectable channel spacing of 10kHz for AM operation and 2000 channels at 100kHz for FM operation.

AM/FM Frequency Synthesizer Circuit Description



The frequency synthesizer circuit logic diagram is shown below. Following is a description of each of the major blocks.

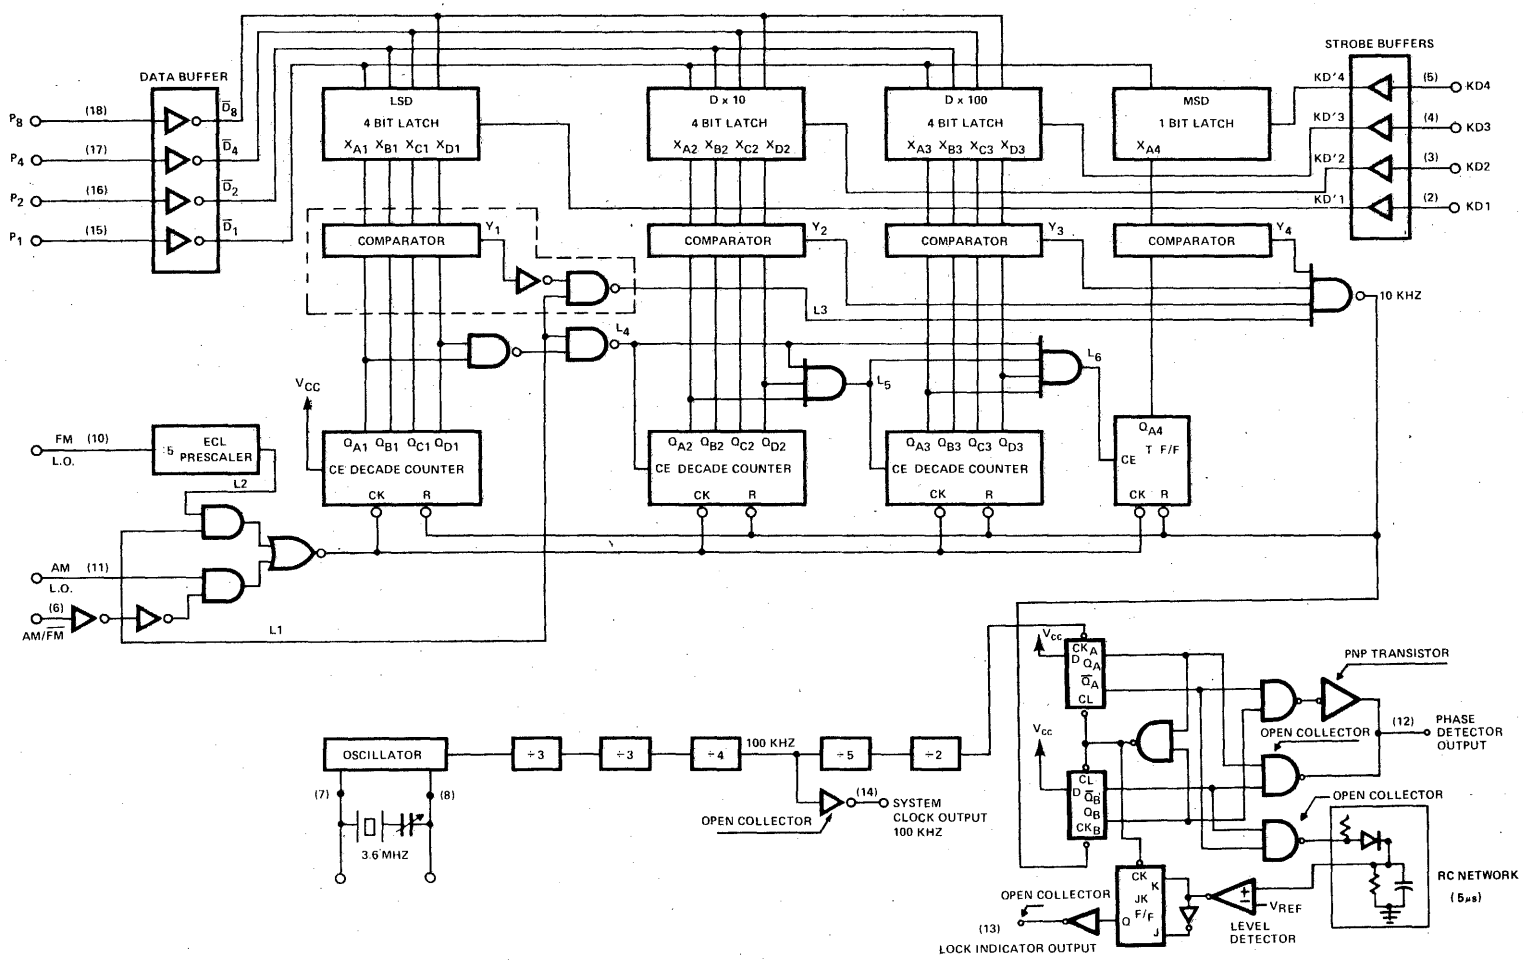
Programmable Counter

The programmable counter consists of 3 stages of decade counter plus a divide by 1 or 0 counter to divide by numbers up to 1999. BCD programming data is presented to the dividers in parallel form, one digit at a time. Parallel data is strobed into internal latches via strobe signals; one strobe for each digit. A ÷ 5 80MHz ECL prescaler precedes the programmable counter for FM operation. This prescaler plus an external 160MHz ÷ 2 flip-flop provide a ÷ 10 160MHz prescaler (÷M) function to scale the programmable counter input frequency down to 16MHz maximum. A logic control circuit bypasses the ÷M prescaler and the first decade counter for AM operation. By this technique, the channel spacing is programmable to 10kHz for AM operation and 100kHz for FM operation.

PIN CONFIGURATION

F, XA PACKAGE

VCO



An externally provided integrator and voltage controlled oscillator must be provided to perform the complete frequency synthesizer function. The integrator converts the pulses that come from the phase detector into a dc signal that controls the output frequency of the voltage controlled oscillator. It is in the integrator part of the circuit that the critical loop constants are determined. The voltage controlled oscillator is normally a LC tuned oscillator with varactor diode tuning that is controlled by the dc signals from the integrator. In this case, two are required, one for the AM band and one for the FM band. The FM oscillator output must be +5V ECL compatible while the AM oscillator must be TTL compatible.

RECOMMENDED OPERATING CONDITIONS

PARAMETER		LIMITS			UNIT
		Min	Typ	Max

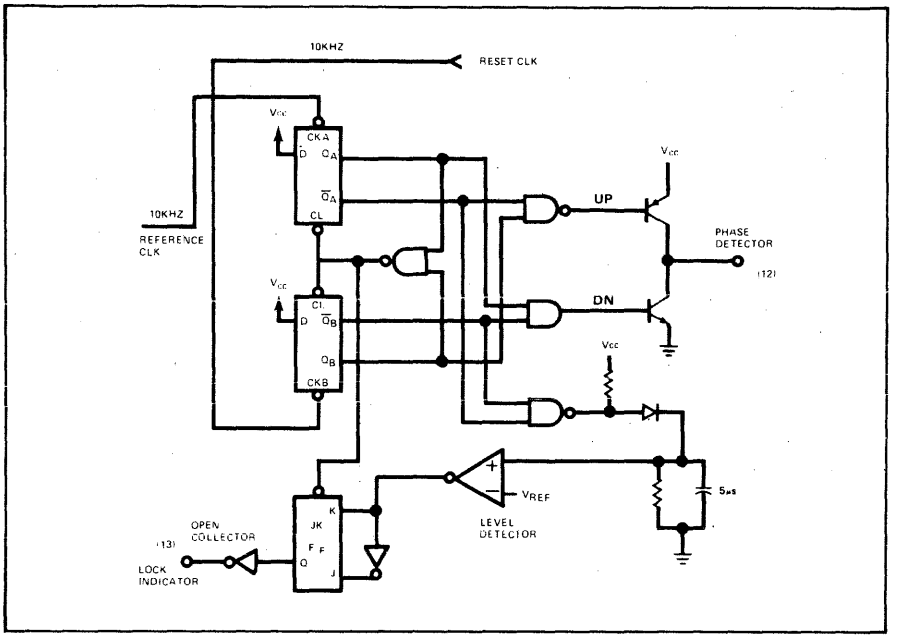
	Max FM local oscillator input operating frequency (Pin 10)		100	80	MHz
	Maximum reference frequency oscillator operating frequency		6		MHz

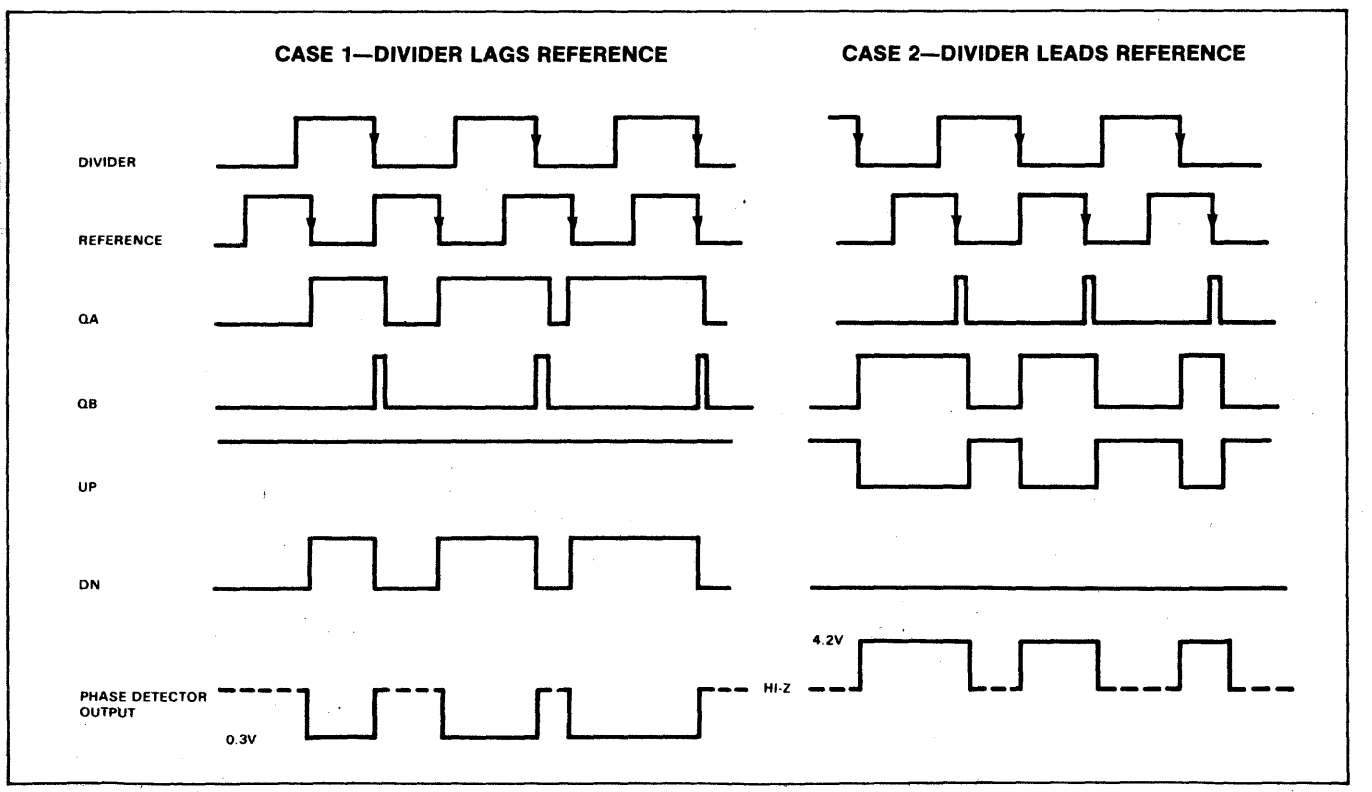
©IC MASTER 1979

LOGIC DIAGRAM



©IC MASTER 1979

Phase Detector Circuit



The phase detector is a digital edge-detecting device that provides an output three-state signal that is in a high impedance state when the 2 input signals are equal in phase and/or frequency. The output of the phase detector is a series of pulses that swing from the high impedance state to .3V typical or from the high impedance state to 4.2V typical. If the positive edge of the divider input leads the reference, the pulses will go to 4.2V. If it lags they will go to .3V.

The width of the output pulses is a function of the time between the positive edges (phase) of the 2 signals. An example of the operation of the device is shown where the reference signal is twice the frequency of the divider signal and has a phase lead of 270°. The output pulses are converted to a dc signal by integrating amplifiers causing the output frequency of the voltage controlled oscillator to increase or decrease (increase in this case) until the divider output and the reference output are equal in phase and frequency.

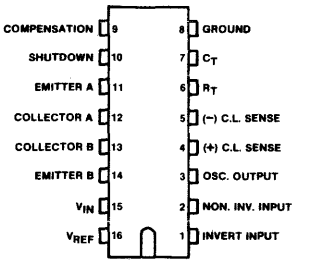
SG1524/2524/3524 REGULATING PULSE WIDTH MODULATOR

DESCRIPTION

This monolithic integrated circuit contains all the control circuitry for a regulating power supply inverter or switching regulator. Included in a 16-pin dual-in-line package is the voltage reference, error-amplifier, oscillator, pulse width modulator, pulse steering flip-flop, dual alternating output switches and current limiting and shut-down circuitry. This device can be used for switching regulators of either polarity, transformer coupled DC to DC converters, transformerless voltage doublers and polarity converters, as well as other power control applications. The SG1524 is specified for operation over the full military temperature range of −55° C to +125° C, while the SG2524 and SG3524 are designed for commercial applications of 0° C to +70° C.



FEATURES

- **Complete PWM power control circuitry**
- **Single ended or push-pull outputs**
- **Line and load regulation of 0.2%**
- **1% maximum temperature variation**
- **Total supply current less than 10 mA**
- **Operation beyond 100kHz**

SG1627/3627 DUAL HIGH-CURRENT OUTPUT DRIVER

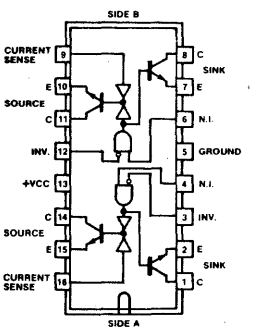
DESCRIPTION

The SG1627 and SG3627 devices are monolithic, high-speed driver integrated circuits designed to interface digital control logic with high current loads. Each device contains two independent drivers which will either source or sink up to 500 mA of current. The sink transistor is designed as a saturating switch while the source transistor can be used either as a switch or as a constant current generator with external resistor programming.

Each half of this device contains both inverting and noninverting inputs which have two volt thresholds for high noise immunity. Either input can be used alone to switch the output, or one input can be strobed with the other. These units have been designed to directy interface with the SG1524 Regulating Pulse Width Modulator Circuit.

These devices are supplied in ceramic 16-pin D.I.L. packages. The SG1627 is specified for operation over a −55° C to +125° C temperature range while the SG3627 is intended for industrial applications of 0° C to +100° C.

FEATURES



- **Two independent driver circuits**
- **Outputs will source or sink currents to 500 mA**
- **100 nSec response time**
- **Full compatibility with SG1524 PWM circuit**
- **Constant current drive capability**
- **Two volt threshold for high noise immunity**
- **Source and sink can be separated for complementary outputs**

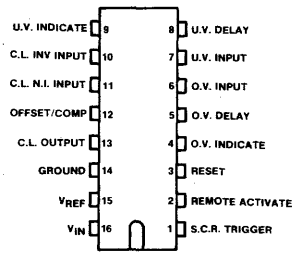
SG1543/2543/3543 POWER SUPPLY OUTPUT SUPERVISORY CIRCUIT

DESCRIPTION

This monolithic integrated circuit contains all the functions necessary to monitor and control the output of a sophisticated power supply system. Over-voltage (O.V.) sensing with provision to trigger an external SCR "crowbar" shutdown; and under-voltage (U.V.) circuit which can be used to monitor either the output or to sample the input line voltage; and a third op amp/comparator usable for current sensing (C.L.) are all included in this IC, together with an independent, accurate reference generator.

Both over and under voltage sensing circuits can be externally programmed for minimum time duration of fault before triggering. All functions contain open collector outputs which can be used independently or wire-or'ed together, and although the SCR trigger is directly connected only to the over voltage sensing circuit, it may be optionally activated by any of the other outputs, or the outputs from additional external comparators like the SG139/239/339 for multiple-output monitoring. The O.V. circuit also includes an optional latch and external reset capability.

The current sense circuit may be used with external compensation as a linear amplifier or as a high-gain comparator. Although nominally set for zero input offset, a fixed threshold may be added with an external resistor. Instead of current limiting, this circuit may also be used as an additional voltage monitor.



The reference generator circuit is internally trimmed to eliminate the need for external potentiometers and the entire circuit may be powered directly from either the output being monitored or from a separate bias voltage.

The SG1543 is specified for operation over the full military temperature range of −55° C to +125° C, while the SG2543 and SG3543 are designed for commercial applications of 0° C to +70° C.

FEATURES

- **Over-voltage, under-voltage, and current sensing circuits all included**
- **Reference voltage trimmed to 1% accuracy**
- **SCR "Crowbar" drive of 200 mA**
- **Programmable time delays**
- **Open-collector outputs and remote activation capability**
- **Total standby current less than 10 mA**

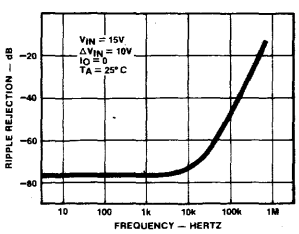
BLOCK DIAGRAM

SG1503/2503/3503 PRECISION 2.5 VOLT REFERENCE

DESCRIPTION

This monolithic integrated circuit is a fully self-contained precision voltage reference generator, interally trimmed for ±1% accuracy. Requiring less than 2 mA in quiescent current, this device can deliver in excess of 10 mA with total load and line induced tolerances of less than 0.5%. In addition to voltage accuracy, internal trimming achieves a temperature coefficient of output voltage of typically 10 ppm/° C. As a result, these references are excellent choices for application to critical instrumentation and D to A converter systems. The SG1503 is specified for operation over the full military temperature range of −55° C to +125° C, while the SG2503 and SG3503 are designed for commercial applications of 0° C to +70° C.



FEATURES

- **Output voltage trimmed to ±1%**
- **Input voltage range of 4.5 to 40V**
- **Temperature coefficient of 10 ppm/° C**
- **Quiescent current typically 1.5 mA**
- **Output current in excess of 10 mA**
- **Interchangeable with MC1503 and AD580**

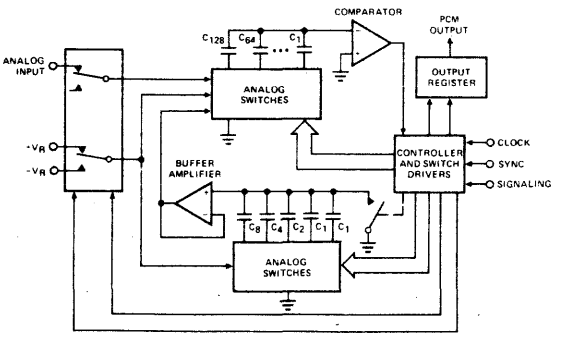
CMOS μ-255 law companding converter set *designed for . . .*

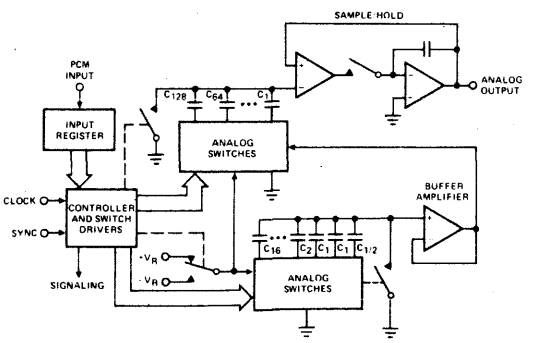
- **Telecommunications Channel Banks**
- **Servo Control Systems**
- **Microprocessor Interface**
- **Remote Data Acquisition Systems**
- **Audio Delay Lines**

BENEFITS



- Minimizes System Power Requirements
- Reduces External Component Requirements
- Reduces System Costs
- Easily Interfaced
- Eliminates Channel Crosstalk Problems
- Eliminates External Signalling Logic
- No External Zero Code Suppression Required
- Reduced System Noise Problems
- No External Sample and Hold or MUX Required
- No Additional Logic Required for Extended Bandwidth Applications
  - 3.5 to 9 KHz Bandwidth Possible With Clock Frequency From 1.25 to 3.0 MHz

DESCRIPTION



The DF331 (coder) is an analog-to-digital converter which has a transfer characteristic conforming to the telecommunication industry μ-255 law. Its counterpart, the DF332 or DF334 (decoder) is a digital-to-analog converter which also conforms to the μ-255 law.

Together the DF331 and DF332 or DF331 and DF334 form a CODEC (coder-decoder set) which is designed to meet the needs of the telecommunications industry for per channel voice frequency CODECs used in PCM Channel Bank and PBX systems. Digital output and input of the coder and decoder is in serial format. Actual transmission and reception of 8-bit data words containing the analog information is typically done at a 1.544 megabit/sec rate with analog signal sampling occurring at an 8 kHz rate. A sync pulse input pin is provided for synchronizing transmission and reception of multi-channel information being multiplexed over a single transmission line. The DF332 and DF334 differ in the output device for the A/B signal output pins, refer to the Functional Description.

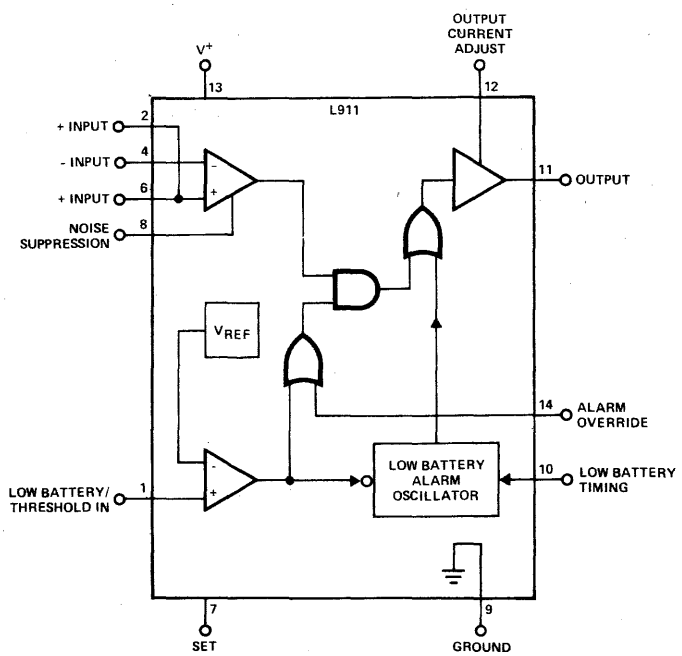
micropower comparator detector alarm circuit

designed for . . .

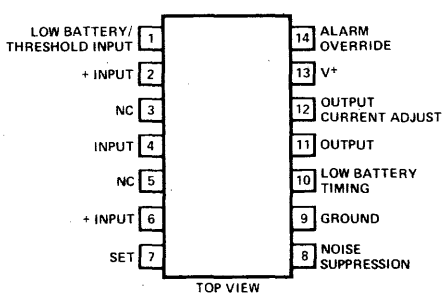
- **Burglar Alarm Systems**
- **Moisture Sensor Systems**
- **Temperature Detection Systems**
- **Emergency Lighting Detection Systems**
- **Excessive Noise Sound Level Detectors**
- **Remote Heat Sensor**



BENEFITS

- **Minimizes System Power Requirements**
  - Supply Current Less Than 10 μA
  - Allows Greater Than 1 Year of 9 V Alkaline Battery Life
- **Simple Maintenance of System**
  - Includes Weak Battery Threshold Voltage Detection Circuitry
  - Outputs Trouble Alarm Signal
- **Reduces External Component Requirements**
  - No Buffers Required for High Impedance Transducers ($R_{IN} > 1000M\ \Omega$)
  - Directly Interfaces to TTL or CMOS Logic
  - Directly Drives Power SCR's Transistors or VMOS
  - Built-In Reverse Battery Protection
- **Operation Similar to UL Recognized SM110 Smoke Detector IC**

DESCRIPTION



The L911 is a monolithic bipolar-PMOS integrated circuit intended to meet the system requirements of a micropower detector alarm or ON/OFF control system. The circuit will operate from a supply as low as 6 V and is tested for 15 V conditions. The alarm output can source sufficient current to activate an NPN or SCR buzzer alarm driver and can also interface to TTL or CMOS Logic. The L911 can easily operate with a standby supply current of less than 10 μA from a 9 V battery, and less than 17 μA at 15 V. The high input impedance MOSFET comparator easily interfaces to high impedance sensor devices.

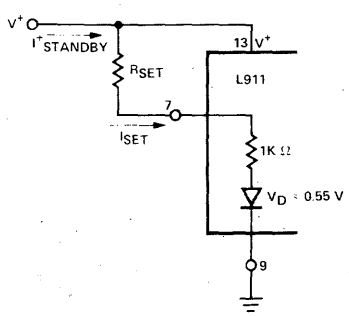
APPLICATION HINTS

Bias Control of Standby Supply Current

The current entering the "SET" input will program the supply standby current at follows:

$$I_{SET} = \frac{V^+ - 0.55\ V}{R_{SET}}$$



The supply current is:

$$I^+ \text{ STANDBY} \approx 4 \times I_{SET}$$

(includes I_{SET} into pin 7).

In the "Low Battery Alarm" condition (with $V^+ \approx 7$ V) the supply current becomes:

$$I^+ \text{ Low Battery Alarm (excluding output pulse)} \approx 7 \times \frac{V^+ \text{ LOW BATTERY} - 0.55\ V}{R_{SET}}$$

Low Battery Alarm Oscillator Timing

t_{ch} – charge time (oscillation OFF period)

$$t_{ch} = \frac{\Delta V_C}{I_{CH}} \times C_T \text{ where}$$

$\Delta V_C = V_{C\ HIGH} - V_{C\ LOW}$ (capacitor charge and discharge voltage levels).

$\Delta V_C \approx 2.6\ V - 0.7\ V = 1.9\ V$

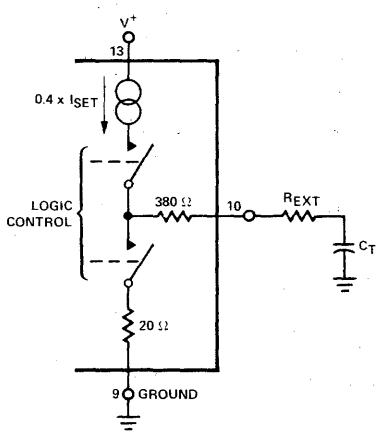
$I_{CH} = 0.4 \times I_{SET} = 0.4 \times (V^+ - 0.55)/R_{SET}$

C_T = timing capacitor from Low Battery Timing to Ground.

In Figure 1, for $V^+ = 7$ V:

$$t_{ch} = \frac{1.9\ V}{0.32\ \mu A} \times 4.7\ \mu F \approx 28 \text{ sec.}$$

t_{DIS} – Discharge time (oscillation ON pulse).



$$t_{DIS} = \left| \left[\ln \frac{I_{HOLD}\ R}{1.91} \right] \tau \right|$$

where I_{HOLD} = SCR Holding current $\approx 100\ \mu A$
R = Series Resistance $\approx 400\ \Omega$ ($R_{EXT} = 0\ \Omega$)
τ = RC Time constant

with C = 4.7 μF (as in Figure 1), $\tau = 400\ \Omega \times 4.7\ \mu F = 1.9$ msec.

$t_{DIS} = 7.3$ msec

To increase t_{DIS}, external resistance can be added in series with C_T (see the graph of typical Discharge Time vs External Resistance).

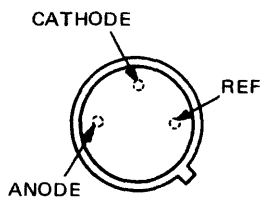
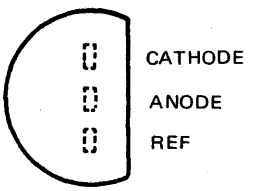
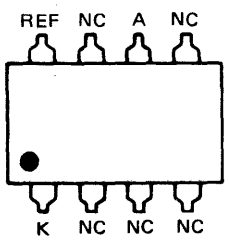
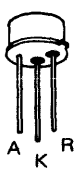
ADJUSTABLE PRECISION SHUNT REGULATORS

BULLETIN NO. DL-S 12644, JULY 1978





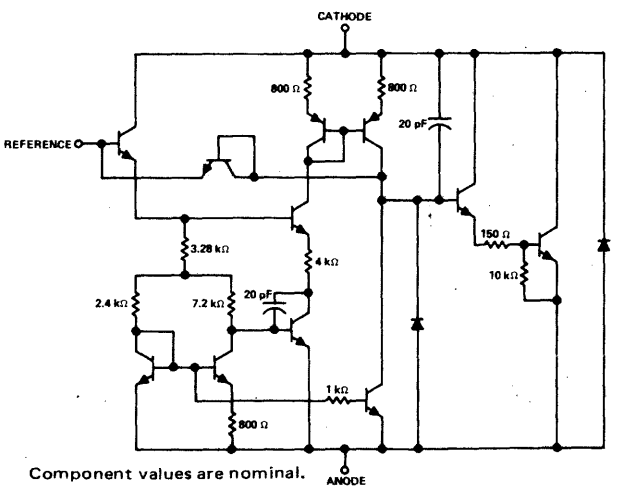




- Equivalent Full-Range Temperature Coefficient . . . 50 ppm/°C Typ
- Temperature Compensated for Operation Over Full Rated Operating Temperature Range
- Adjustable Output Voltage
- Fast Turn-On Response
- Sink Current Capability . . . 1 mA to 100 mA
- Low (0.2-Ω Typ) Dynamic Output Impedance
- Low Output Noise Voltage

description

The TL431 is a three-terminal adjustable regulator series with guaranteed thermal stability over applicable temperature ranges. The output voltage may be set to any value between V_{ref} (approximately 2.5 volts) and 36 volts with two external resistors (see Figure 2). These devices have a typical dynamic output impedance of 0.2 Ω. Active output circuitry provides a very sharp turn-on characteristic, making these devices excellent replacements for zener diodes in many applications.



The TL431M is characterized for operation over the full military temperature range of −55°C to 125°C. The TL431I is characterized for operation from −40°C to 85°C, and the TL431C from 0°C to 70°C.

†Full temperature range is −55°C to 125°C for the TL431M, −40°C to 85°C for the TL431I, and 0°C to 70°C for the TL431C.

‡The deviation parameters $V_{ref(dev)}$ and $I_{ref(dev)}$ are defined as the differences between the maximum and minimum values obtained over the rated temperature range. The equivalent full-range temperature coefficient of the reference input voltage, αV_{ref}, is defined as:

$$\left|\alpha V_{ref}\right| \left(\frac{ppm}{°C}\right) = \frac{\left(\frac{V_{ref(dev)}}{V_{ref\ @\ 25°C}}\right) \times 10^6}{\Delta T_A}$$

where ΔT_A is the rated operating free-air temperature range of the device.

αV_{ref} can be positive or negative depending on whether minimum V_{ref} or maximum V_{ref}, respectively, occurs at the lower temperature (see Figure 8).

Example: Max V_{ref} = 2500 mV @ 30°C, Min V_{ref} = 2492 mV @ 0°C, V_{ref} = 2495 mV @ 25°C, ΔT_A = 70°C for TL431C

$$\left|\alpha_{Vref}\right| = \frac{\left(\frac{8\ mV}{2495\ mV}\right) \times 10^6}{70°C} = 46\ ppm/°C$$

Because minimum V_{ref} occurs at the lower temperature, the coefficient is positive.

§The dynamic impedance is defined as:

$$\left|z_{ka}\right| = \frac{\Delta V_{KA}}{\Delta I_K}$$

When the device is operated with two external resistors (see Figure 2), the total dynamic impedance of the circuit is given by:

$$\left|z'\right| = \frac{\Delta V}{\Delta I} \approx \left|z_{ka}\right| \left(1 + \frac{R1}{R2}\right)$$

description

The TL494 incorporates on a single monolithic chip all the functions required in the construction of a pulse-width-modulation control circuit. Designed primarily for power supply control, the TL494 contains an on-chip 5-volt regulator, two error amplifiers, adjustable oscillator, dead-time control comparator, pulse-steering flip-flop, and output-control circuitry. The uncommitted output transistors provide either common-emitter or emitter-follower output capability. Push-pull or single-ended output operation may be selected through the output-control function. The architecture of the TL494 prohibits the possibility of either output being pulsed twice during push-pull operation. The internal amplifiers exhibit a common-mode voltage range from −0.2 volt to V_{CC} − 2 volts. The dead-time control comparator has a fixed offset that provides approximately 5% dead time unless externally altered. The on-chip oscillator may be bypassed by terminating R_T (pin 6) to the reference output and providing a sawtooth input to C_T (pin 5), or it may be used to drive the common TL494 circuitry and provide a sawtooth input for associated control circuitry in synchronous multiple-rail power supplies.

FUNCTION TABLE

INPUTS		OUTPUT FUNCTION
OUTPUT CONTROL	STEERING INPUT (TL495 only)	
Grounded	Open	Single-ended or parallel output
At V_{ref}	Open	Normal push-pull operation
At V_{ref}	$V_I < 0.4$ V	PWM Output at Q1
At V_{ref}	$V_I > 2.4$ V	PWM Output at Q2

The TL495 provides the identical functions found in the TL494. In addition the TL495 contains an on-chip 39-volt zener diode for high-voltage applications where V_{CC} is greater than 40 volts, and an output steering control that overrides the internal control of the pulse-steering flip-flop.

The TL494C and the TL495C are characterized for operation from 0°C to 70°C.

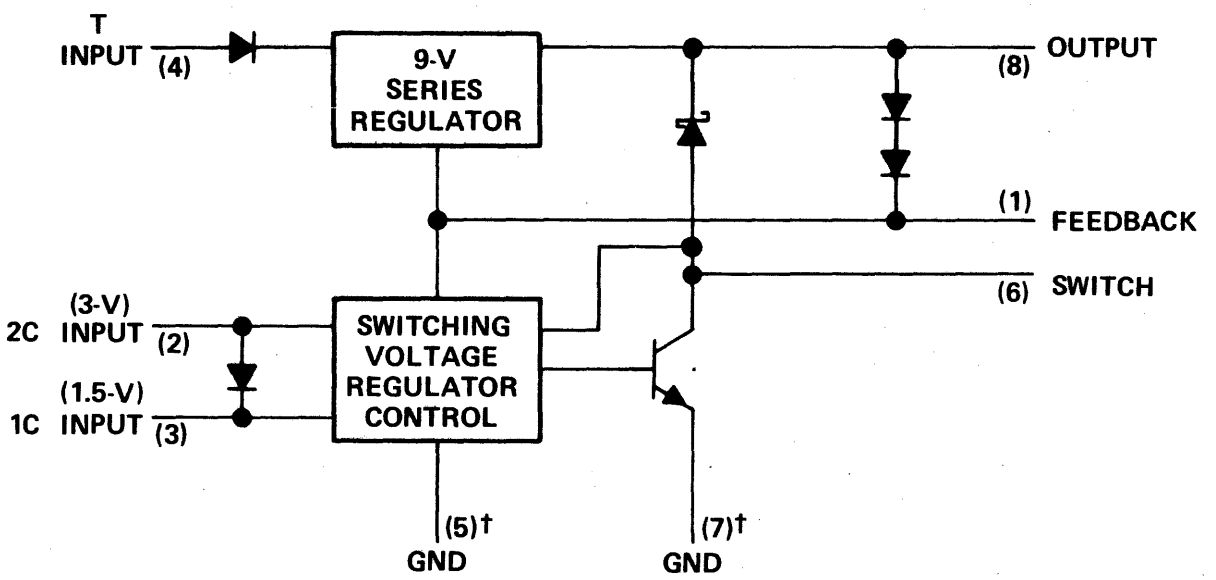
- 1- or 2-Cell-Input Operation



JG OR P
DUAL-IN-LINE PACKAGE
(TOP VIEW)

description

The TL496 power supply control circuit is designed to provide a 9-volt regulated supply from a variety of input sources. Operable from a 1- or 2-cell-battery input, the TL496 performs as a switching regulator with the addition of a single inductor and filter capacitor. When ac coupled with a step-down transformer, the TL496 operates as a series regulator to maintain the regulated output voltage and, with the addition of a single catch diode, time shares to recharge the input batteries.

functional block diagram

†Even though connected internally, pins 5 and 7 must both be terminated to ground to ensure proper circuit operation.

functional description

The TL496 is designed to operate from either a single-cell or two-cell source. To operate the device from a single cell (1.1 V to 1.5 V) the source must be connected to both inputs 1C and 2C as shown in Figure 1. For two-cell operation (2.3 V to 3.0 V), the input is applied to the 2C input only and the 1C input is left open (see Figure 2).

battery operation

The TL496 operates as a switching regulator from a battery input. The cycle is initiated when a low voltage condition is sensed by the internal feedback (the thresholds at pin 1 and pin 8 are approximately 7.2 and 8.6 volts respectively). An internal latch is set and the output transistor is turned "on." This causes the current in the external inductor (L) to increase linearly until it reaches a peak value of approximately 1 ampere. When the peak current is sensed the internal latch is reset and the output transistor is turned "off." The energy developed in the inductor is then delivered to the output storage capacitor through the blocking diode. The latch remains in the off state until the feedback signal indicates the output voltage is again deficient.

transformer-coupled operation

The TL496 operates on alternate half cycles of the ac input during transformer-coupled operation to, first, sustain the output voltage and, second, recharge the batteries. The TL496 performs like a series regulator to supply charge to the output filter/storage capacitor during the first half cycle. The output voltage of the series regulator is slightly higher voltage than that created by the switching circuit; this maintains the feedback voltage above the switching regulator control circuit threshold. This effectively inhibits the switching control circuitry. During the second half cycle an external diode (1N4001) is used to clamp the negative going end of the transformer secondary to ground thus allowing the positive-going end (end connected to V+ side of battery) to pump charge into the stand-by batteries.

general

The design of the TL496 allows minimal supply current drain during stand-by operation (125 uA typical). With most battery sources this allows a constant bias to be maintained on the power supply. This allows instant power available to the system thus eliminating power-up sequencing problems.

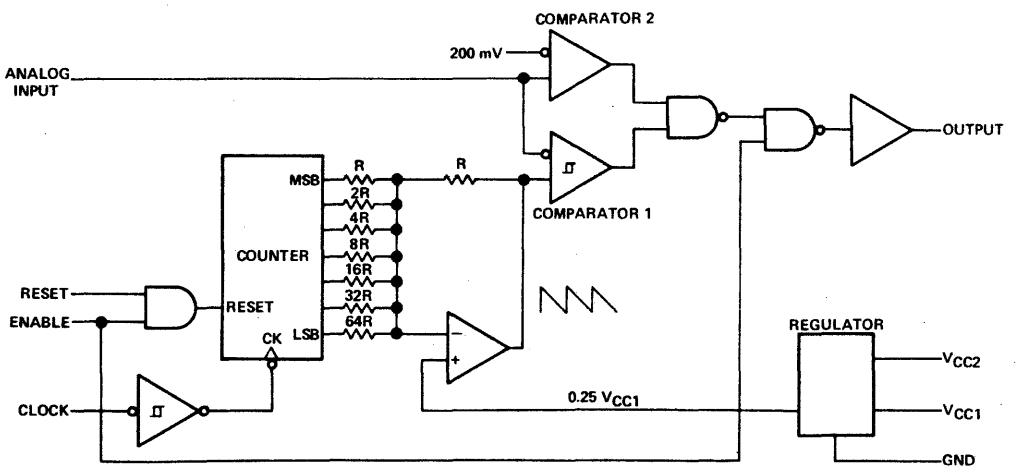
description

The TL507C is a single-slope analog-to-digital converter designed for use with TMS 1000 type microprocessors. It contains a 7-bit synchronous counter, a binary weighted resistor ladder network, an operational amplifier, two comparators, a buffer amplifier, an internal regulator, and necessary logic circuitry. Integrated-injection logic (I^2L) technology makes it possible to offer this complex circuit at low cost in a small dual-in-line 8-pin package.

In continuous operation, it is possible to obtain conversion speeds up to 1000 per second. The TL507 requires external signals for clock, reset, and enable. Versatility and simplicity of operation coupled with low cost, makes this converter especially useful for a wide variety of applications.



The TL507C is characterized for operation from 0°C to 70°C.

FUNCTION TABLE

ANALOG INPUT CONDITION	ENABLE	OUTPUT
X	L†	H
$V_I < 200$ mV	H	L
$V_{ramp} > V_I > 200$ mV	H	H
$V_I > V_{ramp}$	H	L

† Low level on enable also inhibits the reset function.
H = high level, L = low level, X = irrelevant

PARAMETER MEASUREMENT INFORMATION

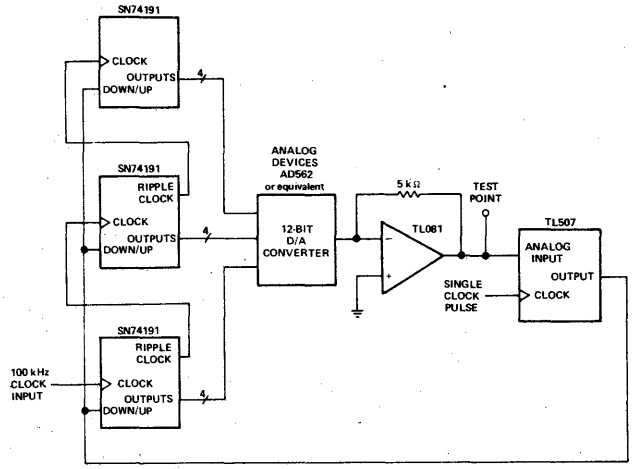

FIGURE 1—MONOTONICITY AND NONLINEARITY TEST CIRCUIT

PRINCIPLES OF OPERATION

The TL507 is a single-slope analog-to-digital converter. All single-slope converters are basically voltage-to-time or current-to-time converters. A study of the functional block diagram shows the versatility of the TL507.

An external clock signal is applied through a buffer to a negative-edge-triggered synchronous counter. Binary-weighted resistors from the counter are connected to an operational amplifier used as an adder. The operational amplifier generates a signal that ramps from $0.75 \cdot V_{CC1}$ down to $0.25 \cdot V_{CC1}$. Comparator 1 compares the ramp signal to the analog input signal. Comparator 2 functions as a fault defector. With the analog input voltage in the range $0.25 \cdot V_{CC1}$ to $0.75 \cdot V_{CC1}$, the duty cycle of the output signal is determined by the unknown analog input as shown in Figure 2 and the Function Table.

For illustration assume $V_{CC1} = 5.12$ V,

$$0.25 \cdot V_{CC1} = 1.28 \text{ V}$$

$$1 \text{ binary count} = \frac{(0.75 - 0.25)\, V_{CC1}}{128} = 20 \text{ mV}$$

$$0.75 \cdot V_{CC1} - 1 \text{ count} = 3.82 \text{ V}$$

The output is an open-collector n-p-n transistor capable of withstanding up to 18 volts in the off state. The output is current limited to the 8- to 12-milliampere range; however, care must be taken to ensure that the output does not exceed 5.5 volts in the on state.

The voltage regulator section allows operation from either an unregulated 8- to 18-volt V_{CC2} source or a regulated 3.5- to 6-volt V_{CC1} source. Regardless of which external power source is used, the internal circuitry operates at V_{CC1}. When operating from a V_{CC1} source, V_{CC2} may be connected to V_{CC1} or left open. When operating from a V_{CC2} source, V_{CC1} can be used as a reference voltage output.

MEMORY.....

The Master Selection Guide provides sufficient information to make initial product selections. It enables you to find the products which are most appropriate to fulfill your major requirements and then provides data for many of the more important products.

All devices that appear in this section, both in the initial selection guide and in the data pages, are included in all other indexes. These index listings lead to the page and the line on that page where each device appears.

The Memory Section provides initial selection information and data on PROMs, RAMs, and ROMs as well as other memory devices. In these particular sections, the devices are characterized by organization (words and bits/word) and by access times. In order to assure that the access times are comparable, whenever possible the values have been shown in nanoseconds over the full rated temperature range for the devices (i.e., 0° to 70°C for commercial units and −55°C to 125°C for military units). The full temperature nanosecond value is marked "nsF." When this value isn't specified, the guaranteed nanosecond value at room temperature is listed followed by "nsR." In some cases a guaranteed value has not yet been established; then the typical value is shown followed by "ns," "* ".."Typical" values are invariably much faster than the guaranteed ones so that such listings place these memories higher on the list than they otherwise would appear.

YESTERDAY'S RADIO MASTER IS TODAY'S

ELECTRONIC DISTRIBUTORS MASTER CATALOG

First published to serve you in 1935, The Radio Electronic Master has continuously changed over the years to better meet your needs. Today The Radio Master has become The Electronic Distributors MASTER CATALOG.

The 1979 edition of The Electronic Distributors MASTER CATALOG includes components, systems and subsystems sold through distributors.

It encompasses the following product areas: electronic and electromechanical components, audio and communications equipment, sub-assembly and panel components, hardware, production equipment and tools, test instrumentation, power sources, wire and cable, and chemicals.

The MASTER CATALOG is divided into four basic sections:

The **GENERAL INDEX** lists manufacturers and products alphabetically, including product cross references. Page numbers are displayed for both manufacturers and products. Manufacturers names are **bold-faced.**

The **MANUFACTURERS' CATALOG SECTION** is a collection of their respective product pages, alphabetically by manufacturer, again including addresses and phone numbers.

The **MANUFACTURERS DIRECTORY** is an alphabetical listing of all manufacturers whose products information is shown. Page numbers are referenced. Sales offices, representatives and distributors are included for many manufacturers.

The **DEALER/DISTRIBUTOR DIRECTORY** geographically lists distribution outlets by state and city. The listings were supplied by manufacturers cataloging in this edition.

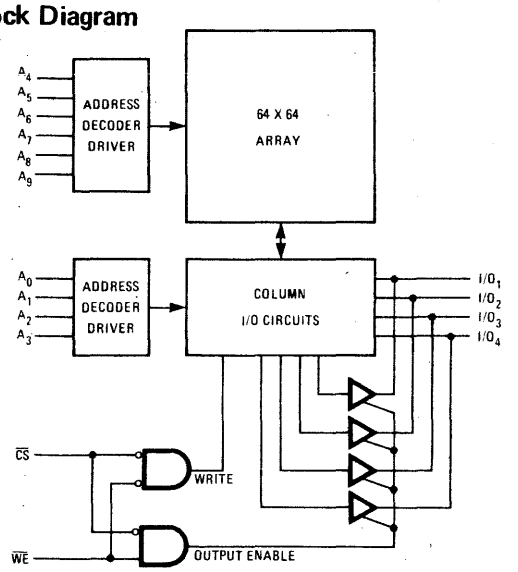
4096 BIT (1024x4) STATIC VMOS RAM

Features

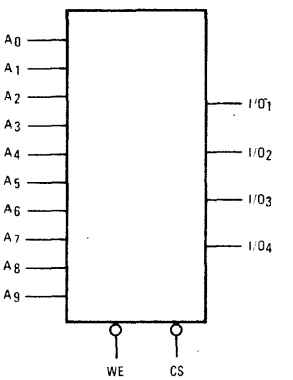
- ☐ High Speed Operation: Access Time: 150ns Maximum (-1)
- ☐ High Density 18 Pin Package
- ☐ Single +5 Volt Power Supply
- ☐ Completely Static Operation: No Clocks Required
- ☐ Completely TTL Compatible
- ☐ Common Data I/O: Three-State Outputs
- ☐ Fan-Out of 5 TTL: I_{OL} = 8mA @ 0.4V



General Description

The AMI S2114 is a 4096 bit fully static RAM organized as 1024 words by 4 bits. The device is fully TTL compatible on all inputs and outputs and has a single +5V supply. The common data input/output pins facilitate interface with systems utilizing a bidirectional data bus. The stored data is read out non-destructively and is the same polarity as the original input data.

The S2114 is fully static requiring no clocks or refreshing for operation. This simplifies device operation as no address setup times are required. The chip select function facilitates memory system expansion by allowing the input/output pins to be OR-tied to other devices.



The S2114 is fabricated using AMI's proprietary VMOS technology. This process permits the manufacture of high performance memory devices suitable for high volume production.

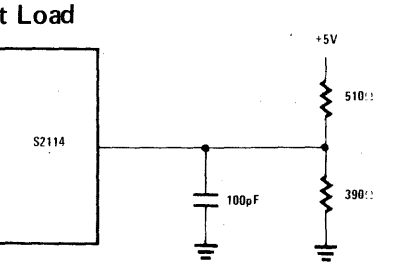
Propagation Delay From Chip Select

Write Cycle (note 2)



NOTES:
1. A read occurs during the overlap of a LOW $\overline{CS}$ and a HIGH $\overline{WE}$.
2. A write occurs during the overlap of a LOW $\overline{CS}$ and a LOW WE.
3. t_{WR} is referenced to the positive transition of $\overline{WE}$.
4. $\overline{WE}$ must be HIGH during all address transitions.
5. If the $\overline{CS}$ LOW transition occurs simultaneously with the $\overline{WE}$ LOW transition, then the output buffers remain in the high impedance state.

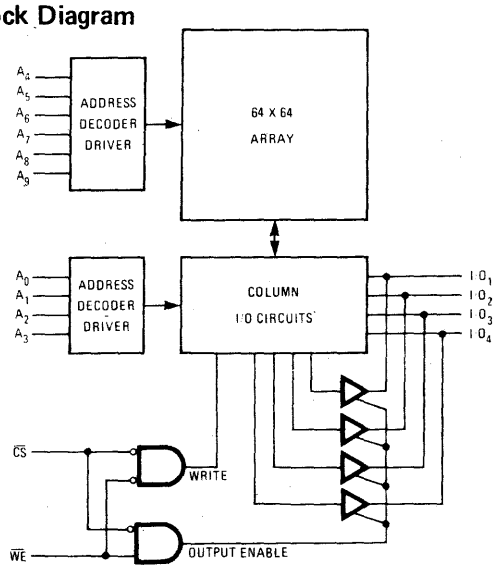
4096 BIT (1024x4) HIGH SPEED STATIC VMOS RAM

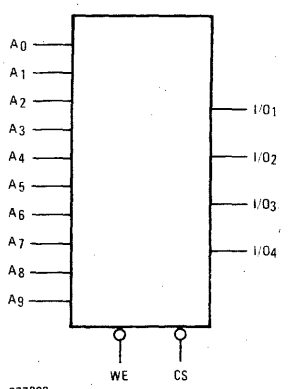
Features

- ☐ High Speed Operation: Access Time: 70ns Maximum
- ☐ High Density 18 Pin Package
- ☐ Single +5 Volt Power Supply
- ☐ Completely Static Operation: No Clocks Required
- ☐ Completely TTL Compatible
- ☐ Common Data I/O: Three-State Outputs
- ☐ Fan-Out of 5 TTL: I_{OL}= 8mA @0.45V



General Description

The AMI S2114H is a 4096 bit fully static RAM organized as 1024 words by 4 bits. The device is fully TTL compatible on all inputs and outputs and has a single +5V supply. The common data input/output pins facilitate interface with systems utilizing a bidirectional data bus. The stored data is read out non-destructively and is the same polarity as the original input data.



The S2114H is fully static requiring no clocks or refreshing for operation. This simplifies device operation as no address setup times are required. The chip select function facilitates memory system expansion by allowing the input/output pins to be OR-tied to other devices.

The S2114H is fabricated using AMI's proprietary VMOS technology. This process permits the manufacture of high performance memory devices suitable for high volume production.

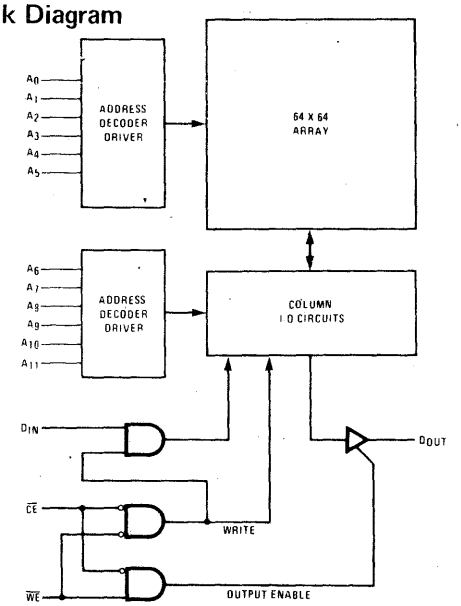
4096 BIT (4096×1) HIGH SPEED STATIC VMOS RAM

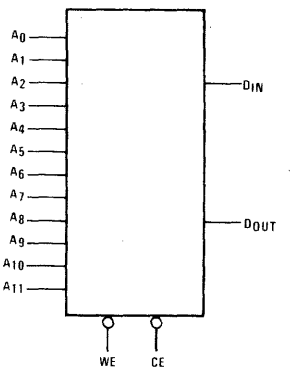
Features

- ☐ High Speed Operation: Access Time: 55ns Max. (-3)
- ☐ Automatic Power-Down
- ☐ High Density 18 Pin Package
- ☐ Single +5V Power Supply
- ☐ Completely Static Operation
- ☐ Completely TTL Compatible Inputs
- ☐ Three-State TTL Compatible Output
- ☐ Fan-Out of 5 TTL: I_{OL} = 8mA @ 0.45V



General Description

The AMI S2147 is a high speed 4096 bit fully static RAM organized as 4096 one-bit words. The device is fully TTL compatible and has a single +5V power supply. It has separate data input and output pins for maximum design flexibility. The three-state output facilitates memory expansion by allowing the output to be OR-tied to other devices. The stored data is read out non-destructively and is the same polarity as the input data.



The automatic power down feature offers significant system power savings. This feature causes no performance degradation, as chip enable access and address access are equal. The S2147 is fully static eliminating the need for clocks or address set up and hold times as well as maximizing data rates since access times and cycle times are equal.

The S2147 is fabricated using AMI's proprietary VMOS technology. The process permits the manufacture of high performance memory devices suitable for high volume production.

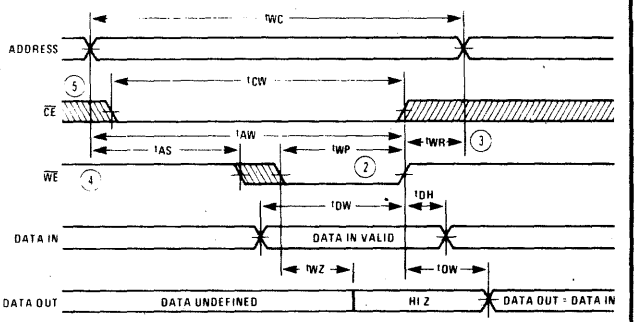
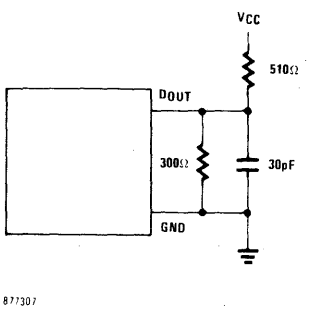
t_{OW}	Output Active from End of Write	0	25	0	30	ns	

READ CYCLE

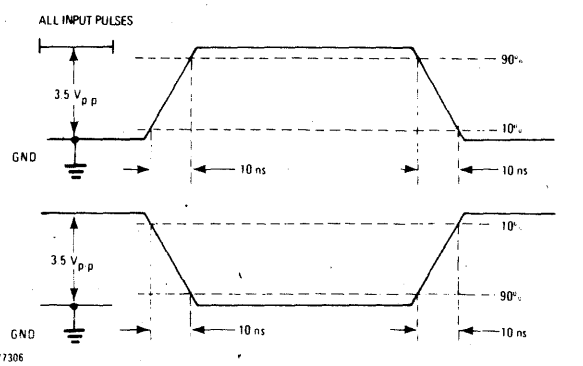


Propogation Delay From Address Inputs

Propagation Delay From Chip Enable



WRITE CYCLE



NOTES:
1. A read occurs during the overlap of a LOW $\overline{CE}$ and a HIGH $\overline{WE}$.
2. A write occurs during the overlap of a LOW $\overline{CE}$ and a LOW $\overline{WE}$.
3. t_{WR} is referenced to the positive transition of $\overline{WE}$.
4. $\overline{WE}$ must be HIGH during all address transitions.
5. If the $\overline{CE}$ LOW transition occurs simultaneously with the $\overline{WE}$ LOW transition, then output buffers remain in the high impedance state.

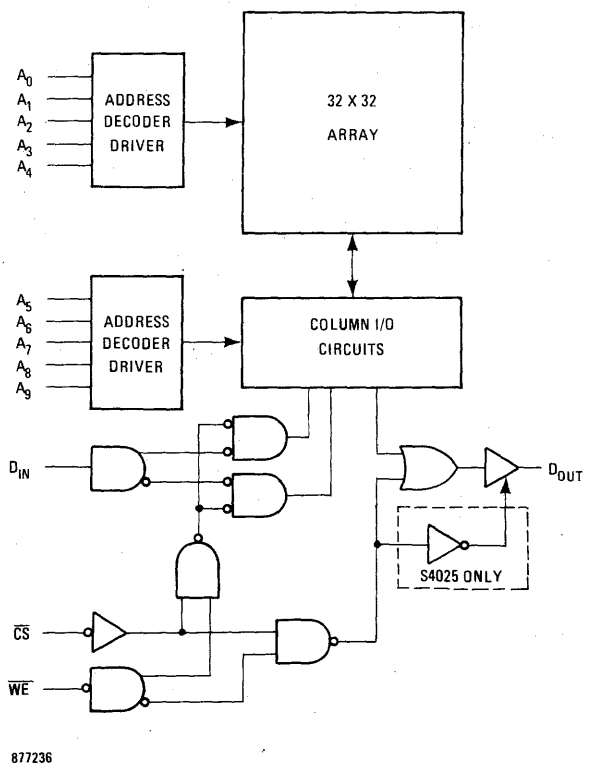
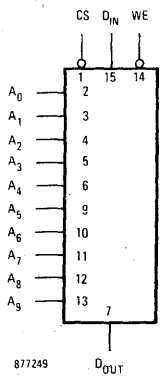
1024 BIT (1024x1)
HIGH SPEED STATIC VMOS RAM

Features



- ☐ **Pin Compatible with 93415 (S4015) and 93425 (S4025)**
- ☐ **Single +5V Power Supply**
- ☐ **Completely TTL Compatible**
- ☐ **Open Collector Output — S4015**
- ☐ **Three-State Output — S4025**
- ☐ **Fan-Out of 10 TTL — I_{OL} = 16mA @0.45V**
- ☐ **Completely Static — no Clocks or Refreshing**

General Description



The AMI S4015/S4025 family of 1024x1 bit high speed VMOS RAMs offers fully static operation with a single 5V supply. The device is completely TTL compatible on inputs and output. The family is available in two output configurations. The S4015 has an open collector (open drain) output and the S4025 has a three-state output. The stored data is read out nondestructively and is the same polarity as the original input data.

The family is completely static requiring no clocks or refreshing for operation. Chip Select ($\overline{CS}$) controls the output and simplifies memory system expan-sion. The fast chip select time allows decoding the chip select from the address without increasing address access time.

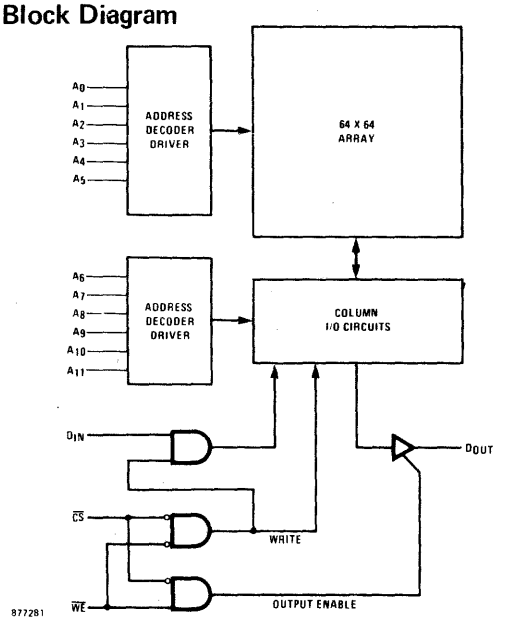
4096 BIT (4096x1) HIGH SPEED STATIC VMOS RAM

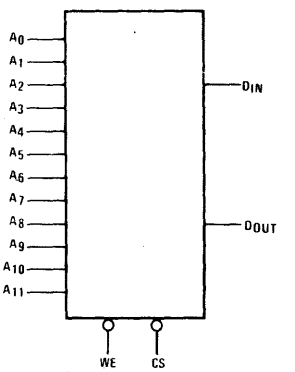
Features

- ☐ High Speed Operation:
  - Address Access Time: 55ns Maximum
  - Chip Select Access Time: 30ns Maximum
- ☐ Fast Chip Select Optimizes Access Time
- ☐ High Density 18 Pin Package
- ☐ Single +5V Power Supply
- ☐ Completely Static Operation
- ☐ Completely TTL Compatible Inputs
- ☐ Three-State TTL Compatible Output
- ☐ Fan-Out of 5 TTL: I_{OL} = 8mA @ 0.45V



General Description

The AMI S4017 is a high speed 4096 bit fully static RAM organized as 4096 one-bit words. The device is fully TTL compatible and has a single + 5V power supply. It has separate data input and output pins for maximum design flexibility. The three-state output facilitates memory expansion by allowing the output to be OR-tied to other devices. The stored data is read out non-destructively and is the same polarity as the original input data.



The fast chip select access time offers a significant performance advantage. As the chip select is normally decoded from the address, the time required to decode the chip select will not impact the overall access time.

The S4017 is fabricated using AMI's proprietary VMOS technology. The process permits the manufacture of high performance memory devices suitable for high volume production.

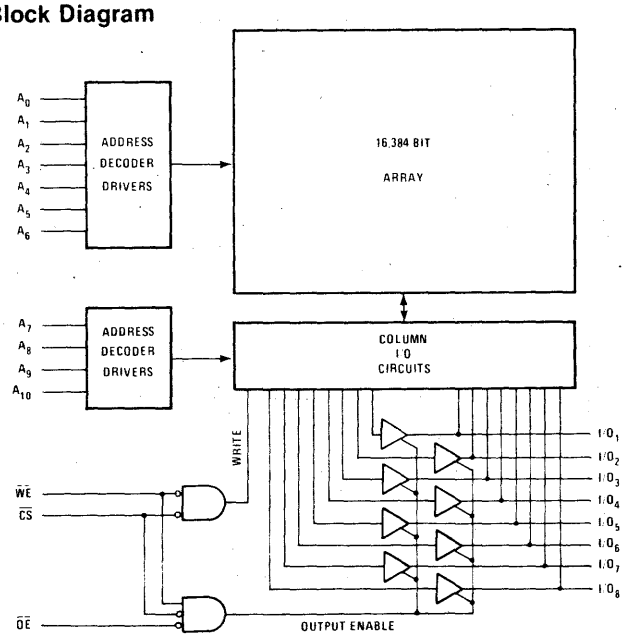
16,384 BIT (2048 X 8) STATIC VMOS RAM

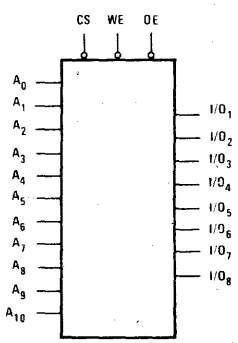
Features

- ☐ **High Speed Operation: Access Time: 200ns Max.**
- ☐ **Single +5V Power Supply**
- ☐ **Pin Compatible with 16K EPROM/ROM**
- ☐ **Fully Static Operation**
- ☐ **Completely TTL Compatible**
- ☐ **Common Data Input/Output: Three-State Outputs**
- ☐ **Output Enable Function for Easy Control of Data Output**



General Description

The AMI S4028 is a 16,384 bit fully static VMOS random access memory organized as 2048 words by 8 bits. The device is fully TTL compatible on all inputs and outputs and has a single +5V power supply. The common data input/output pins and output enable function facilitate interface with systems utilizing a bi-directional data bus. Data is read out non-destructively and is the same polarity as the input data.



The S4028 is fully static requiring no clocks or refreshing for operation. This simplifies device operation as no address setup or hold times are required. The chip select and output enable functions facilitate memory expansion by allowing the input/output pins to be OR-tied to other devices.

The S4028 is fabricated using AMI's proprietary VMOS technology. This permits the manufacture of high performance memory devices suitable for high volume production.

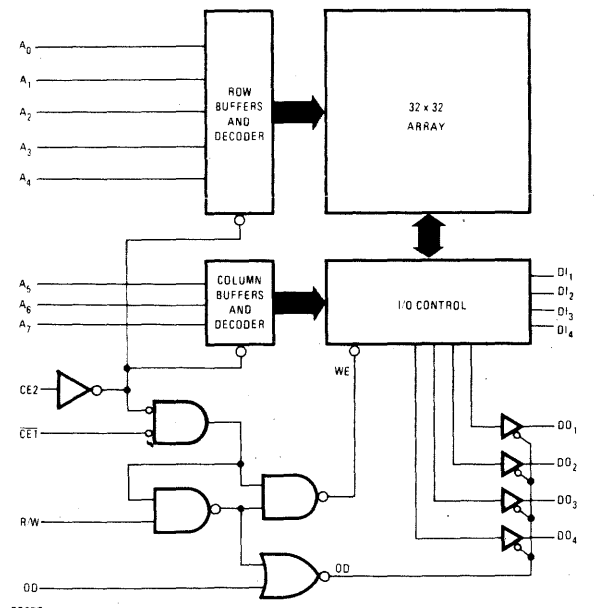
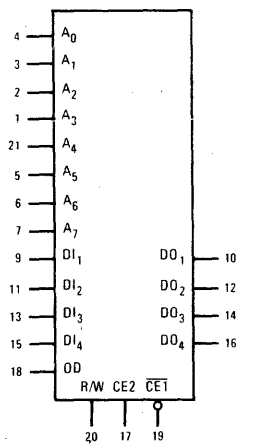
1024 BIT (256x4) STATIC CMOS RAM



Features

- ☐ Ultra Low Standby Power
- ☐ Data Retention at 2V (L Version)
- ☐ Single +5 Volt Power Supply
- ☐ Completely Static Operation
- ☐ Completely TTL Compatible Inputs
- ☐ Three-State TTL Compatible Outputs

General Description



The AMI S5101 family of 256 x 4-bit ultra low power CMOS RAMs offers fully static operation with a single + 5 volt power supply. All inputs and outputs are directly TTL compatible. With data inputs and outputs on adjacent pins, either separate or common data I/O operations can easily be implemented for maximum design flexibility. The three-state outputs will drive one full TTL load and are disabled (high impedance state) by output disable (OD), either chip enable ($\overline{CE1}$ or CE2), or in a write cycle (R/W = LOW). This facilitates the control of common data I/O systems.

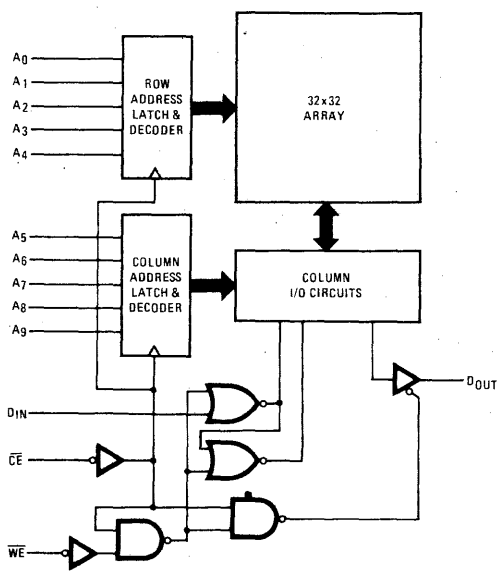
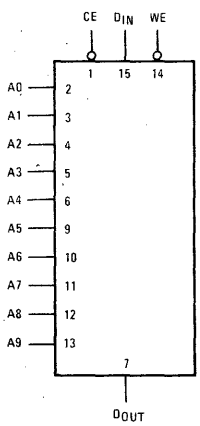
1024 BIT (1024 x 1) STATIC CMOS RAM



Features

- ☐ Ultra Low Standby Power
- ☐ S6508 Completely TTL Compatible
- ☐ S6508A Completely CMOS Compatible
- ☐ 4V to 11V Operation (S6508A)
- ☐ Data Retention at 2V
- ☐ Three-State Output
- ☐ Low Operating Power: 10mW @ 1MHz (5V)
- ☐ Fast Access Time: 115ns @ 10V



General Description

The AMI S6508 family of 1024x1 bit static CMOS RAMs offers ultra low power dissipation with a single power supply. The device is available in two versions. The basic part (S6508) operates on 5V and is directly TTL compatible on all inputs and the three-state output. The S6508 "A" operates from 4V to 11V and is fully CMOS compatible. The data is stored in ultra low power CMOS static RAM cells (six transistor). The stored data is read out nondestructively and is the same polarity as the original input data. The address is buffered by on-chip address registers. These internal registers are latched by the HIGH to LOW transition of chip enable ($\overline{CE}$). The write enable and chip enable functions are designed such that either separate or common data I/O operations can be easily implemented for maximum design flexibility.

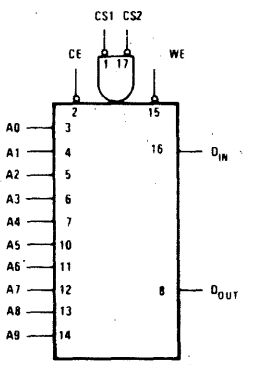
- ☐ Data Retention at 2V
- ☐ Three-State Output
- ☐ Low Operating Power: 10mW @1MHz (5V)
- ☐ Fast Access Time: 115ns @10V



General Description

The AMI S6518 family of 1024x1 bit static CMOS RAMs offers ultra low power dissipation with a single power supply. The device is available in two versions. The basic part (S6518) operates on +5V and is directly TTL compatible on all inputs and the three-state output. The S6518 "A" operates from +4V to +11V and is fully CMOS compatible. The data is stored in ultra low power CMOS six transistor static RAM cells. The data is read out non-destructively (into a data latch) and is the same polarity as the original input data. The address is buffered by on-chip address registers. These internal registers are latched by the HIGH to LOW transition of chip enable ($\overline{CE}$). In addition, there are two chip selects ($\overline{CS1}$ and $\overline{CS2}$) which facilitate memory expansion. The write enable, chip enable and chip select functions are designed such that either separate or common data I/O operations can be easily implemented.

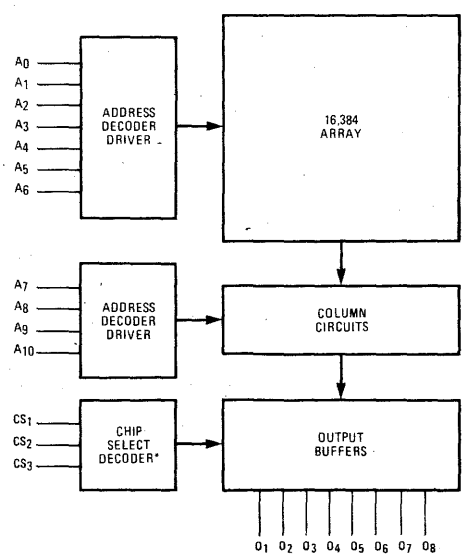
16,384 BIT (2048 x 8) STATIC VMOS ROM

Features

- ☐ Fast Access Time: 250ns Maximum
- ☐ Fully Static Operation
- ☐ Single +5V ± 10% Power Supply
- ☐ Directly TTL Compatible Inputs
- ☐ Three-State TTL Compatible Outputs
- ☐ Three Programmable Chip Selects
- ☐ EPROM Pin Compatible
- ☐ Fan-Out of 5 TTL: I_{OL} = 8mA @ 0.4V



General Description

The AMI S4216B is a 16,384 bit static mask programmable VMOS ROM organized as 2048 words by 8 bits. The device is fully TTL compatible on all inputs and outputs and has single + 5V power suply. The three-state outputs facilitate memory expansion by allowing the outputs to be OR-tied to other devices.

The S4216B is fully compatible with 16K UV EPROMs (+ 5V version) making system development much easier and more cost effective. It is fully static, requiring no clocks for operation. The three chip selects are mask programmable, the active level for each being specified by the user.

The S4216B is fabricated using AMI's proprietary N-Channel VMOS technology. This permits the manufacture of very high density, high performance mask programmable ROMs.

Custom Programming

The preferred method of pattern submission is the AMI Hex format as described below, with its built-in address space mapping and error checking. This is the format produced by the AMI Assembler. The format is as follows and may be on paper tape, punched cards or other media readable by AMI.

Position	Description
1	**Start of record (Letter S)**
2	**Type of record** 0 — Header record (comments) 1 — Data record 9 — End of file record
3, 4	**Byte Count** Since each data byte is represented as two hex characters, the byte count must be multiplied by two to get the number of characters to the end of the record. (This includes checksum and address data.) Records may be of any length defined in each record by the byte count.
5, 6, 7, 8	**Address Value** The memory location where the first data byte of this record is to be stored. Addresses should be in ascending order.
9, . . ., N	**Data** Each data byte is represented by two hex characters. Most significant character first.
N+1, N+2	**Checksum** The one's complement of the additive summation (without carry) of the data bytes, the address, and the byte count.

Example:

```
S 1 1 3 0 0 0 0 4 9 E 9 F 1 0 3 2 0 F 0 4 9 3 1 3 9 F 7 2 0 0 0 F 5 E 0 F 0 0 1 2 6
S 9 0 3 0 0 0 0 F C
```

NOTES:
1. Only positive logic formats for E_0, E_1, E_2 are accepted. 1 = V_{HIGH}; 0 = V_{LOW}
2. A "0" indicates the chip is enabled by a logic 0.
   A "1" indicates the chip is enabled by a logic 1.
3. Paper tape format is the same as the card format above except:
   a. The record should be a maximum of 80 characters.
   b. Carriage return and line feed after each record followed by another record.
   c. There should NOT be any extra line feed between records at all.
   d. After the last record, four (4) $$$$ (dollar) signs should be punched with carriage return and line feed indicating end of file.

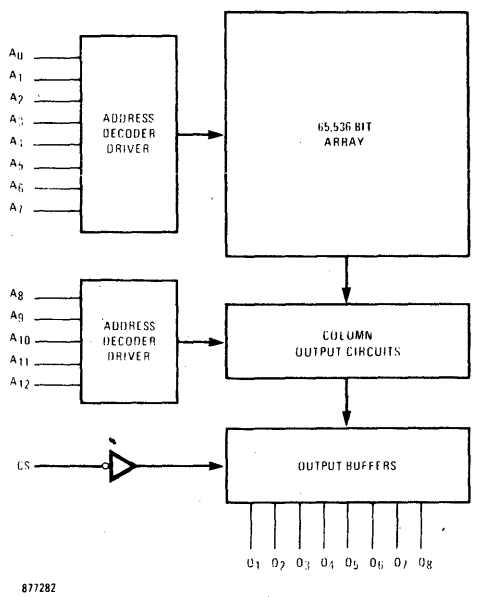
65,536 BIT (8192 x 8) STATIC VMOS ROM

Features

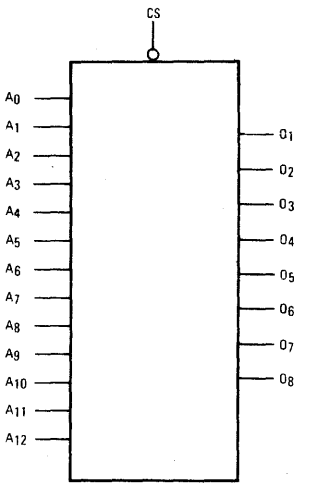
- ☐ Single +5V ± 10% Power Supply
- ☐ High Performance:
  Maximum Access Time: 350ns
- ☐ EPROM Compatible for Cost Effective System Development
- ☐ Completely Static Operation
- ☐ Directly TTL Compatible Inputs
- ☐ Three-State TTL Compatible Outputs
- ☐ Fan-out of 5 TTL: I_{OL} = 8mA @0.4V



General Description

The AMI S4264 is a 65,536 bit fully static VMOS mask programmable ROM organized as 8192 words by 8 bits. The device is fully TTL compatible on all inputs and outputs and has a single +5V power supply. The three-state outputs facilitate memory expansion by allowing the outputs to be OR-tied to other devices.

The S4264 is fully static requiring no clocks for operation. Data access is simple as no address setup times are required. The byte organization of the S4264 makes it ideal for microprocessor applications.



The S4264 is fabricated using AMI's proprietary VMOS technology. This permits the manufacture of very high density, high performance mask programmable ROMs.

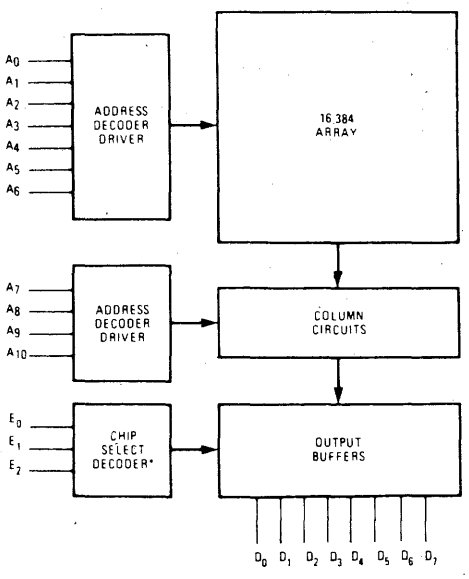
16,384 BIT (2048x8) STATIC NMOS ROM

Features

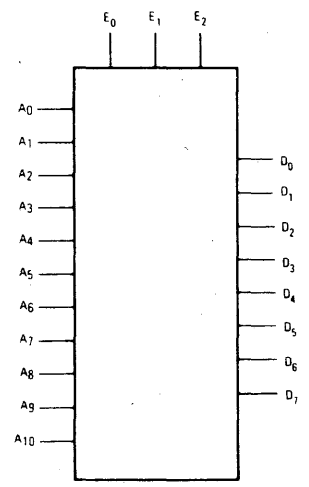
- ☐ Single +5V Power Supply
- ☐ Directly TTL Compatible Inputs
- ☐ Three-State TTL Compatible Outputs
- ☐ Three Programmable Enables
- ☐ Access Time: 450ns Maximum
- ☐ S6831A: Intel 2316A Pin Compatible
- ☐ S6831B: 2716 EPROM Pin Compatible
- ☐ Low Power: Supply Current is 80mA Maximum



General Description

The AMI 6831 family of 16,384 bit mask programmable Read-Only-Memories offers fully static operation with a single + 5V power supply. The device is fully TTL compatible on all inputs and three-state outputs. The three enables are mask programmable, the active level is specified by the user.

The S6831 family is available in two pin configurations. One of these, the S6813A, is the pin configuration of a popular ROM: the Intel 2316A. The second pin configuration, the S6813B, is pin compatible with the 2708 and 2716 EPROMs. Software developed in EPROMs can be put in low cost ROM for high volume production.



The device is organized as 2048 words by 8 bits, a configuration particularly suitable for microprocessors. The S6831 family is manufactured with an N-channel silicon gate depletion load technology.

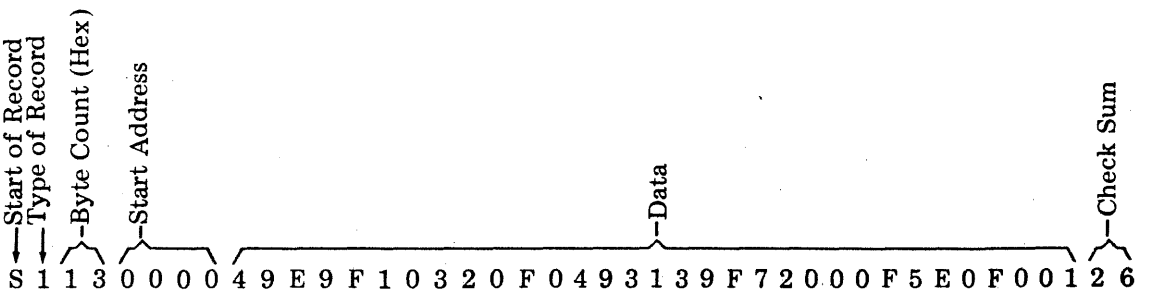
Output Load	1 TTL Load and 100pF



Custom Programming

The preferred method of pattern submission is the AMI Hex format as described below, with its built-in address space mapping and error checking. This is the format produced by the AMI Assembler. The format is as follows and may be on paper tape, punched cards or other media readable by AMI.

Position	Description
1	Start of record (Letter S)
2	Type of record 0 — Header record (comments) 1 — Data record 9 — End of file record
3, 4	Byte Count Since each data byte is represented as two hex characters, the byte count must be multiplied by two to get the number of characters to the end of the record. (This includes checksum and address data.) Records may be of any length defined in each record by the byte count.
5, 6, 7, 8	Address Value The memory location where the first data byte of this record is to be stored. Addresses should be in ascending order.
9, . . ., N	Data Each data byte is represented by two hex characters. Most significant character first.
N+1, N+2	Checksum The one's complement of the additive summation (without carry) of the data bytes, the address, and the byte count.

Example:

```
S 1 1 3 0 0 0 0 4 9 E 9 F 1 0 3 2 0 F 0 4 9 3 1 3 9 F 7 2 0 0 0 F 5 E 0 F 0 0 1 2 6
S 9 0 3 0 0 0 0 F C
```

NOTES:

1. Only positive logic formats for CS_1 and CS_2 are accepted. 1 = V_{HIGH}; 0 = V_{LOW}
2. A "0" indicates the chip is enabled by a logic 0.
   A "1" indicates the chip is enabled by a logic 1.
3. Paper tape format is the same as the card format above except:
   a. The record should be a maximum of 80 characters.
   b. Carriage return and line feed after each record followed by another record.
   c. There should NOT be any extra line feed between records at all.
   d. After the last record, four (4) $$$$ (dollar) signs should be punched with carriage return and line feed indicating end of file.

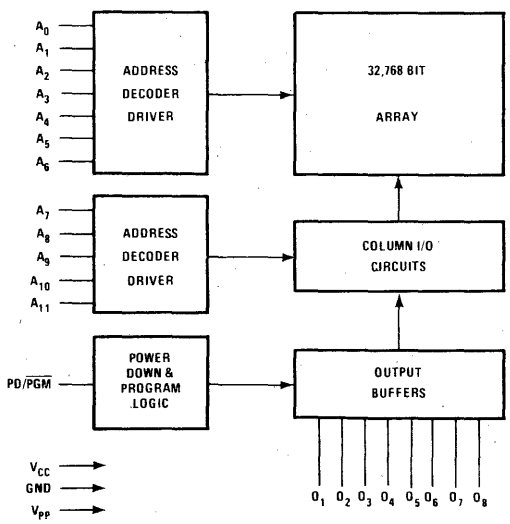
32, 768 BIT (4096 X 8) UV ERASABLE VMOS EPROM

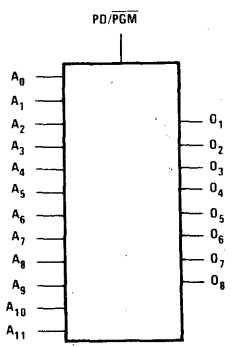
Features

- ☐ **Single +5 Volt Power Supply**
- ☐ **Fast Access Time: 250ns Maximum**
- ☐ **Automatic Power Down**
- ☐ **Pin Compatible with AMI's 32K ROM: S68332**
- ☐ **Fully TTL Compatible During Read and Program**
- ☐ **+15V Programming Power Supply: Easy On-Board Programming**



General Description

The S4532 is a 32,768 bit ultraviolet light erasable, electrically programmable read-only memory (EPROM) organized as 4096 words by 8 bits. It is fabricated using AMI's proprietary N-channel VMOS technology. The device is fully static requiring no clocks for operation. All the inputs and outputs are fully TTL compatible during both the read and program modes. The S4532 operates from a single +5V supply (read mode) and has a static power down feature that significantly reduces power dissipation.



The S4532 is pin compatible with AMI's 32K ROM, the S68332. Thus for volume production, the user can switch to lower cost ROM.

The S4532 requires a +15V supply for programming but all the programming signals are TTL compatible. This considerably eases on-board programming.

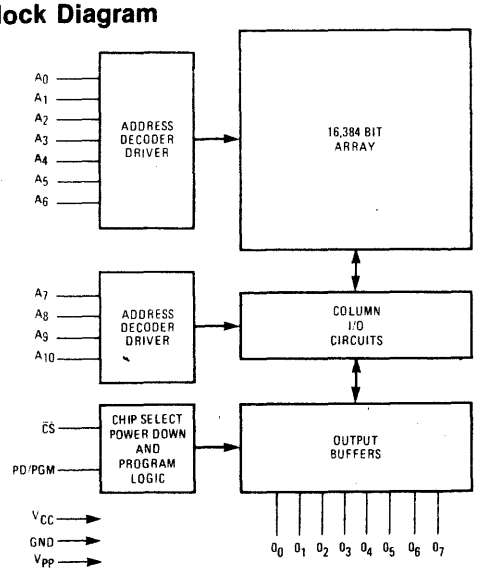
16,384 BIT (2048 X 8) UV ERASABLE VMOS EPROM

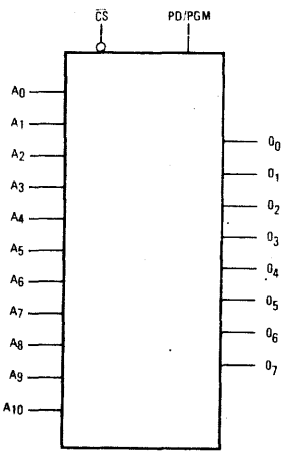
Features

- ☐ **Single +5 Volt Power Supply**
- ☐ **Fast Access Time: 250ns Maximum**
- ☐ **Pin Compatible with AMI's 16K, 32K and 64K ROMs**
- ☐ **Low Power Dissipation**
  525mA Maximum Active Power
  132mW Maximum Standby Power
- ☐ **Fully TTL Compatible During Read and Program**
- ☐ **+15V Programming Power Supply: Easy On-Board Programming**



General Description

The S4716 is a 16,384 bit ultraviolet light erasable, electrically programmable read-only memory (EPROM) organized as 2048 words by 8 bits. It is fabricated using AMI's proprietary N-Channel VMOS technology. The device is fully static requiring no clocks for operation. All the inputs and outputs are fully TTL compatible during both the read and program modes. The S4716 operates from a single +5V power supply and has a static power down feature that significantly reduces power dissipation.



The S4716 is fully pin compatible with the S4216B and S6831B 16K ROMs, the S68332 32K ROM and the S4264 64K ROM. Thus for volume production, the user can switch to a lower cost ROM.

The S4716 requires a +15V supply for programming but all the programming signals are TTL. This considerably eases on-board programming.

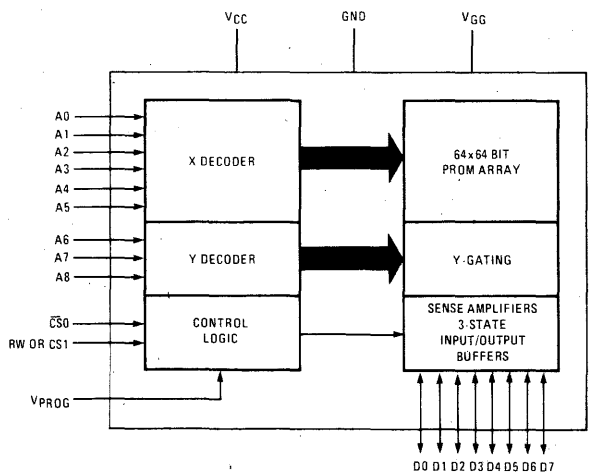
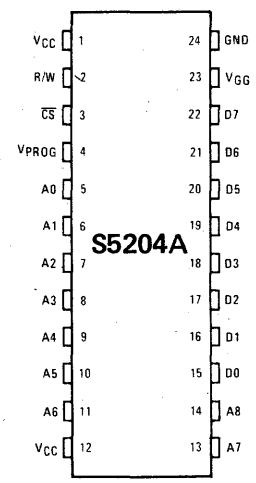
512 × 8 BIT ERASABLE AND ELECTRICALLY REPROGRAMMABLE READ ONLY MEMORY



Features

- ☐ On-Board Programmability
- ☐ Fast Access Time — 750ns Max.
- ☐ High Speed Programming — Less than 1 Minute for all 4096 Bits
- ☐ Programmed with R/W, CS and V_{PROG} Pins
- ☐ Completely TTL Compatible — Excluding the V_{PROG} Pin during Read or Write
- ☐ Ultraviolet Light Erasable — Less than 10 Minutes
- ☐ Static Operation — No Clocks Required
- ☐ Three-State Data I/O
- ☐ Standard Power Supplies — +5V and - 12V
- ☐ Mature P-Channel Process

General Description



The S5204A is a high speed, static, 512x8 bit, erasable and electrically programmable read only memory designed for use in bus-organized systems. Both input and output are TTL compatible during both read and write modes. Packaged in a 24-pin hermetically sealed dual in-line package, the bit pattern can be erased by exposing the chip to an ultraviolet light source through the transparent lid, after which a new pattern can be written.

Block Diagram

77675

Pin Configuration

877254

Typical Applications

- ☐ ROM Program Debugging
- ☐ Code Translation
- ☐ Microprogramming
- ☐ Look-up Tables
- ☐ Random Logic Replacement
- ☐ Programmable Waveforms
- ☐ Character Generation
- ☐ Electronic Keyboards

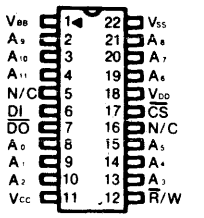
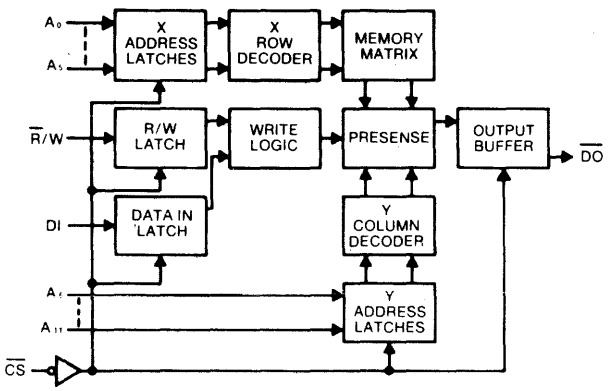
EMM 4300

SEMI 4300 120NSEC, STATIC, TTL IN/OUT, 4096x1 N-MOS RAM



FEATURES

- Completely Static
- Access Time as low as 120 nsec max
- Cycle Time as low as 250 nsec max
- Typical Operating Power Under 450 mw.
- Typical Standby Power Under 30 mw.
- Data Retention with Low V_{DD}
- Pin and Voltage Compatible with Standard 22 Pin 4K Dynamic Rams
- TTL Compatible Three-State Outputs
- Fully Decoded
- Active Low Chip Select



PIN CONFIGURATION

A_N	Address Inputs
DI	Data Input
$\overline{DO}$	Data Output
$\overline{CS}$	Chip Select Input
$\overline{R}/W$	Read/Write Input
N/C	No Internal Connection
V_{SS}	Ground
V_{BB}	Supply Voltage (−5V)
V_{CC}	Supply Voltage (+5V)
V_{DD}	Supply Voltage (+12V)

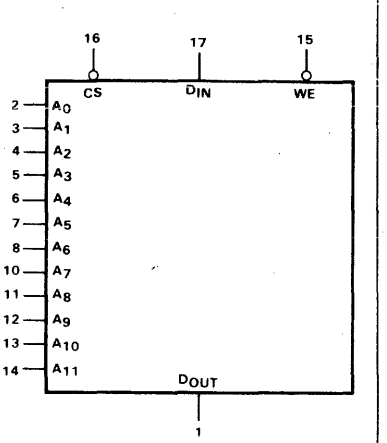
TTL ISOPLANAR MEMORY

4096 x 1-BIT FULLY DECODED RANDOM ACCESS MEMORY



DESCRIPTION — These devices are 4096-bit TTL Read/Write Random Access Memories organized 4096 words by one bit. The devices are identical except for the output stage. The 93470 and 93L470 have an uncommitted collector output, while the 93471 and 93L471 have a 3-state output. The devices have full decoding on chip, separate Data Input and Data Output lines and active LOW Chip Select lines. They are designed for high performance main memory application and can be used to replace four 1024-bit RAMs The 93L470 and 93L471 are appropriate for systems requiring low power.

- **FULL MIL AND COMMERCIAL TEMPERATURE RANGES**
- **ORGANIZATION — 4096 WORDS x 1 BIT**
- **READ ACCESS TIME — 40 ns TYP FOR 93L470/71, 30 ns TYP FOR 93470/71**
- **CHIP SELECT ACCESS TIME — 20 ns TYP FOR 93L470/71, 15 ns TYP FOR 73470/71**
- **UNCOMMITTED COLLECTOR OUTPUT — 93L470, 93470**
- **3-STATE OUTPUT — 93L471, 93471**
- **NON-INVERTING DAA OUTPUT**
- **POWER DISSIPATION — 0.09 mW/BIT TYP — 93L470/71**
- **POWER DISSIPATION — 0.15 mW/BIT TYP — 93470/71**
- **REPLACES FOUR 1024 BY ONE RAMs**

C_O	Output Pin Capacitance		7	8		7	8		Pulse Technique

NOTES:
1. Conditions for testing, not shown in the Table, are chosen to guarantee operation under "worst case" conditions.
2. The specified LIMITS represents the "worst case" value for the parameters. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
3. Typical values are at V_{CC} = 5.0 V, T_A = 25°C, and MAX loading.
4. The Temperature Ranges are guaranteed with transverse air flow exceeding 400 linear feet per minute and a two minute warm-up. Temperature range of operation refers to case temperature for Flatpaks and ambient temperature for all other packages. Typical thermal resistance values of the package at maximum temperature are:

   θ_{JA} (Junction to Ambient) (at 400 fpm air flow) = 50°C/Watt, Ceramic DIP; 65°C/Watt, Plastic DIP, NA, Flatpak.
   θ_{JA} (Junction to Ambient) (still air) = 90°C, Watt, Ceramic DIP; 110°C/Watt, Plastic DIP, NA, Flatpak.
   θ_{JC} (Junction to Case) = 25°C/Watt, Ceramic DIP; 25°C/Watt, Plastic DIP; 15°C/Watt, Flatpak.

5. The MAX address access time is guaranteed to be the "worst case" bit in the memory using a pseudo random testing pattern.
6. t_W measured at t_{WSA} = MIN, t_{WSA} measured at t_W = MIN.
7. Duration of short circuit should not exceed one second.

©IC MASTER 1979

FUNCTIONAL DESCRIPTION — These devices are fully decoded 4096-bit Random Access Memories organized 4096 words by one bit. Word selection is achieved by means of a 12-bit address, A_0 through A_{11}.

The Chip Select input is provided for logic flexibility. For larger memories, the fast Chip Select access time permits the decoding of Chip Select, $\overline{CS}$, from the address without increasing address access time.

The read and write operations are controlled by the state of the active LOW Write Enable, $\overline{WE}$ (pin 15). With $\overline{WE}$ held LOW and the chip selected, the data at D_{IN} is written into the addressed location. To read, $\overline{WE}$ is held HIGH and the chip selected. Data in the specified location is presented at the Data Output.

The 93471 and 93L471 have 3-state outputs which provide drive capability for higher speeds with high capacitive load systems. The third state (high impedance) allows bus organized systems where multiple outputs are connected to a common bus.

The 93470 and 93L470 have uncommitted collector outputs to allow maximum flexibility in output connection. In many applications, such as memory expansion, the outputs of several 93470s or 93L470s can be tied together. In other applications the wired-OR is not used. In either case an external pull-up resistor of value R_L must be used to provide a HIGH at the output when it is off. Any value of R_L within the range specified below may be used.

$$\frac{V_{CC(max)}}{I_{OL} - F.O.\ (1.6)} \leq R_L \leq \frac{V_{CC(min)} - V_{OH}}{N\ (I_{CEX}) + F.O.\ (0.04)}$$

R_L is in kΩ
N = number of wired-OR outputs tied together
F.O. = number of TTL Unit Loads (U.L.) driven
I_{CEX} = Memory Output Leakage Current in mA
V_{OH} = Required Output HIGH level at Output Node
I_{OL} = Output Low Current

The minimum value of R_L is limited by output current sinking ability. The maximum value of R_L is determined by the output and input leakage current which must be supplied to hold the output at V_{OH}.

TRUTH TABLE

INPUTS			OUTPUTS		MODE
$\overline{CS}$	$\overline{WE}$	D_{IN}	O.C.	3-STATE	
H	X	X	H	HIGH Z	Not Selected
L	L	L	H	HIGH Z	Write "0"
L	L	H	H	HIGH Z	Write "1"
L	H	X	D_{OUT}	D_{OUT}	Read

H = HIGH Voltage, L = LOW Voltage; X = Don't Care (HIGH or LOW)
HIGH Z = High Impedance, OC = Open Collector

ABSOLUTE MAXIMUM RATINGS (above which the useful life may be impaired)

Storage Temperature	−65°C to +150°C
Temperature (Ambient) Under Bias	−55°C to +125°C
V_{CC} Pin Potential to Ground Pin	−0.5 V to +7.0 V

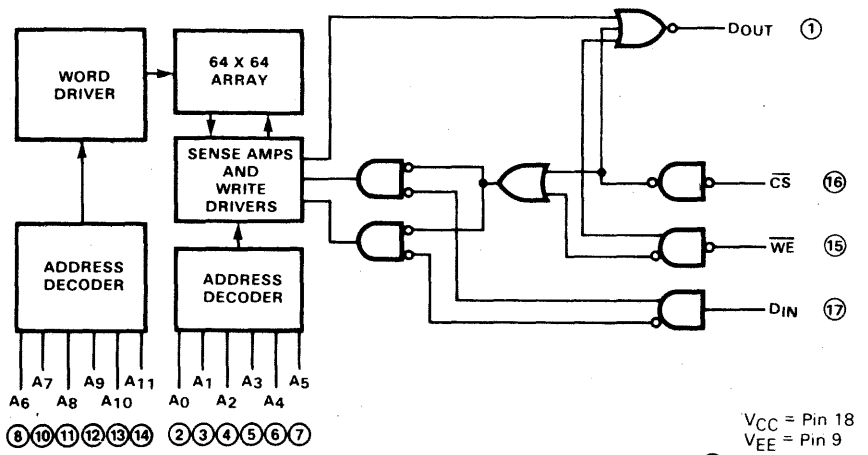
ECL ISOPLANAR MEMORY

4096 x 1-BIT FULLY DECODED RANDOM ACCESS MEMORY

DESCRIPTION — These devices are 4096-bit Read/Write Random Access Memories organized 4096 words by one bit. They are designed for high-speed scratchpad, control and buffer storage applications.

The F10470 is compatible with the F10K and uncompensated 10K ECL logic series and includes on-chip voltage compensation for improved noise margin. The F10470 is specified to operate over the 0° C to 75° C temperature range.

The F100470 has on-chip voltage and temperature compensation and is compatible with the F100K and 95K series of ECL logic. The device is specified to operate over the 0° C to 85° C temperature range.



Features common to both devices are full address decoding on chip, separate Data In and non-inverting Data Out lines and an active LOW Chip Select line. The devices are packaged in a hermetic ceramic 18-pin dual in-line package.

- **ORGANIZED 4096 WORDS BY ONE BIT**
- **OPEN EMITTER OUTPUT FOR EASE OF MEMORY EXPANSION**
- **READ ACCESS TIME — 25 ns TYP**
- **POWER DISSIPATION — 0.2 mW/BIT**
- **F10470 — COMPATIBLE WITH F10K AND UNCOMPENSATED 10K ECL LOGIC**
- **F100470 — COMPATIBLE WITH F100K AND 95K ECL LOGIC**

FUNCTIONAL DESCRIPTION — These devices are fully decoded 4096-bit Random Access Memories organized 4096 words by one bit. Word selection is achieved by means of a 12-bit address, A_0 thru A_{11}.

One chip Select input is provided for memory array expansion up to 8192 words without the need for external decoding. For larger memories, the fast Chip Select access time permits the decoding of Chip Select, $\overline{CS}$, from the address without increasing address access time.

The read and write operations are controlled by the state of the active LOW Write Enable, $\overline{WE}$ (Pin 15). With $\overline{WE}$ held LOW and the chip selected, the data at D_{IN} is written into the addressed location. To read, $\overline{WE}$ is held HIGH and the chip selected. Data in the specified location is presented at D_{OUT} and is non-inverted.

An unterminated emitter-follower output is provided to allow maximum flexibility i output connection. In many applications such as memory expansion, the outputs of many F10470s or F100470s can be tied together. In other applications the wired-OR is not used. In either case an external 50 Ω pull down resistor to -2 V or an equivalent network must be used to provide a LOW at the output when it is off.

ABSOLUTE MAXIMUM RATINGS (above which the useful life may be impaired)

Storage Temperature	−65°C to +150°C
Temperature (Ambient) Under Bias	−55°C to +125°C
V_{EE} Pin Potential to Ground Pin	−7.0 V to +0.5 V
Input Voltage (dc)	V_{EE} to +0.5 V
Output Current (dc Output HIGH)	−30 mA to +0.1 mA

TABLE 1 – TRUTH TABLE

NOTES:
1. Conditions for testing, not shown in the tables are chosen to guarantee operation under "worst case" conditions.
2. The specified Limits represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
3. Typical values are V_{EE} = −4.5 V for F100470, V_{EE} = −5.2 V for F10470, T_A = 25°C and maximum loading unless otherwise specified.
4. Guaranteed with transverse air flow exceeding 400 linear F.P.M. and 2 minute warm-up period. Typical resistance values of the package are:
   θ_{JA} (Junction to Ambient) = 90°C/Watt (still air)
   θ_{JA} (Junction to Ambient) = 50°C/Watt (at 400 F.P.M. air flow)
   θ_{JC} (Junction to Case) = 25°C/Watt
5. The maximum address access time is guaranteed to be the worst case bit in the memory using a pseudorandom testing pattern.
6. DEFINITION OF SYMBOLS AND TERMS USED IN THIS DATA SHEET:
   The symbols and terms used in this data sheet have been chosen to agree with the latest standards of the Electronics Industries Association and the International Electrotechnical Commission. The relative values of the specified conditions and limits will be referenced to an algebraic scale. The extremities of the scale are: "A" the value closest to positive infinity, "B" the value closest to negative infinity.

AC CHARACTERISTICS: F10470: V_{EE} = −5.2 V ±5%, T_A = 0°C to 75°C, Output Load = 50 Ω, 30 pF to −2.0 V
F100470: V_{EE} = −4.5 V ±5%, T_A = 0°C to 85°C, Output Load = 50 Ω, 30 pF to −2.0 V

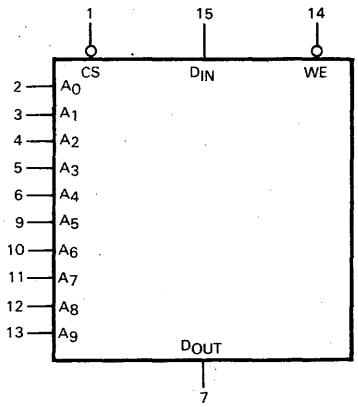
TTL ISOPLANAR MEMORY

1024 x 1-BIT FULLY DECODED RANDOM ACCESS MEMORIES

DESCRIPTION — These devices are 1024-Bit Read/Write Random Access Memories organized 1024 words by one bit and are designed for buffer control storage and high performance main memory applications. The typical access time ranges from 25 ns to 40 ns depending upon the device type. The 93L415 and 93L425 are appropriate for systems requiring low power.



Each 1024-bit memory has full decoding on chip, separate Data Input and Data Output lines and an active LOW Chip Select line. The 93425 and 93L425 have a 3-state output to drive bus organized systems and/or highly capacitive loads and the 93415 and 93L415 have an uncommitted collector output for ease of memory expansion. All of the devices are fully compatible with standard DTL and TTL logic families.

- **FULL MIL AND COMMERCIAL RANGES**
- **3-STATE OUTPUT — 93425 AND 93L425**
- **UNCOMMITTED COLLECTOR OUTPUT — 93415 AND 93L415**
- **NON-INVERTING DATA OUTPUT**
- **ORGANIZED 1024 WORDS x 1 BIT**
- **POWER DISSIPATION 250 mW TYP — 93L415 AND 93L425**
- **POWER DISSIPATION 0.5 mW TYP — 93415 AND 93425**
- **TTL INPUTS AND OUTPUT**
- **POWER DISSIPATION DECREASES WITH INCREASING TEMPERATURE**

93425/93L425 LOGIC DIAGRAM

FUNCTIONAL DESCRIPTION — These devices are fully decoded 1024-Bit Random Access Memories organized 1024 words by one bit. Word selection is achieved by means of a 10-bit address, A_0-A_9. The Chip Select input allows memory array expansion. For large memories, the fast chip select access time permits decoding of the Chip Select ($\overline{CS}$) from the address without affecting system performance. The read and write operations are controlled by the state of the active LOW Write Enable ($\overline{WE}$). With $\overline{WE}$ held LOW and the chip selected, the data at D_{IN} is written into the addressed location. To read, $\overline{WE}$ is held HIGH and the chip selected. Data in the specified location is presented at D_{OUT} and is non-inverted.

93425 and 93L425 Only

The 93425 and 93L425 3-state outputs provide drive capability for higher speeds with high capacitive load systems. The third state (high impedance) allows bus organized systems where multiple outputs are connected to a common bus. During writing, the output is held in the high impedance state.

93415 and 93L415 Only

The 93415 and 93L415 uncommitted collector outputs are provided to allow maximum flexibility in output connection. In many applications such as memory expansion, the outputs of many 93415s or 93L415s can be tied together. In other applications, the wired-OR is not used. In either case, an external pull-up resistor of R_L value must be used to provide a HIGH at the output when it is off. Any R_L value within the range specified below may be used. The minimum R_L value is limited by output current sinking ability. The maximum R_L value is determined by the output and input leakage current which must be supplied to hold the output at V_{OH}. One Unit Load = 40 μA HIGH/1.6 mA LOW.

$$\frac{V_{CC}\,(min)}{I_{OL} - FO\,(1.6)} \leq R_L \leq \frac{V_{CC}\,(min) - V_{OH}}{n\,(I_{CEX}) + FO\,(0.04)}$$

R_L is in kΩ
n = number of wired-OR outputs tied together
FO = number of TTL Unit Loads (UL) driven
I_{CEX} = Memory Output Leakage Current
V_{OH} = Required Output HIGH Level at Output Node
I_{OL} = Output LOW Current

NOTES:
1. Conditions for testing, not shown in the Table, are chosen to guarantee operation under "worst case" conditions.
2. The specified LIMITS represents the "worst case" value for the parameters. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
3. Typical limits are at V_{CC} = 5.0 V, T_A = +25°C, and MAX loading.
4. The Temperature Ranges are guaranteed with transverse air flow exceeding 400 linear feet per minute. For military range an additional requirement of a two minute warm-up. Typical thermal resistance values of the package at maximum temperature are:
   θ_{JA} (Junction to Ambient) (at 400 fpm air flow) = 50°C/Watt, Ceramic DIP; 65°CC/Watt, Plastic DIP; NA, Flatpak.
   θ_{JA} (Junction to Ambient) (still air) = 90°C/Watt, Ceramic DIP; 110°C/Watt, Plastic DIP, NA, Flatpak.
   θ_{JC} (Junction to Case) = 25°C/Watt, Ceramic DIP; 25°C/Watt, Plastic DIP; 10°C/Watt, Flatpak.
5. The MAX address access time is guaranteed to be the "worst case" bit in the memory using a pseudo random testing pattern.
6. t_W measured at t_{WSA} = MIN, t_{WSA} measured at t_W = MIN.
7. Duration of short circuit should not exceed one second.

ECL ISOPLANAR MEMORY
F10415 / F10415A / F100415
1024 x 1-BIT FULLY DECODED RANDOM ACCESS MEMORIES

GENERAL DESCRIPTION — These devices are 1024-bit Read/Write Random Access Memories organized 1024 words by one bit. They are designed for high speed scratch pad, control and buffer storage applications. Both include full address decoding on the chip, have separate Data In and non-inverted Data Out lines, and active LOW Chip Select lines.

- **TYPICAL READ ACCESS TIME**
  F10415 – 25 ns
  F10415A and F100415 – 12 ns
- **TYPICAL CHIP SELECT ACCESS TIME**
  F10415 – 7 ns
  F10415A and 100415 – 5 ns
- **ORGANIZED 1024 WORDS X 1 BIT**
- **OPEN EMITTER OUTPUT FOR EASE OF MEMORY EXPANSION**
- **POWER DISSIPATION: 0.5m W/BIT**
- **F10415/10415 COMPATIBLE WITH F10K AND UNCOMPENSATED 10K ECL LOGIC**
- **F100415 COMPATIBLE WITH F100K AND F95K ECL LOGIC**

FUNCTIONAL DESCRIPTION – The F10415, F10415A and F100415 are fully decoded 1024-bit Read/Write Random Access Memories organized 1024 words by one bit. Bit selection is acheived by means of a 10-bit address, A_0 to A_9. One Chip Select input is provided for memory array expansion up to 2048 words without the need for external decoding. For larger memories, the fast chip select access time permits the decoding of Chip Select ($\overline{CS}$) from the address without increasing address access time. The read and write operations are controlled by the state of the active LOW Write Enable ($\overline{WE}$). With $\overline{WE}$ and $\overline{CS}$ held LOW, the data at D_{in} is written into the addressed location. To read, $\overline{WE}$ is held HIGH and $\overline{CS}$ held LOW. Data in the specified location is presented at D_{OUT} and is non-inverted.

An unterminated emitter-follower output is provided to allow maximum flexibility in output connection. In many applications such as memory expansion, the outputs of many F10415s, F10415As or 100415s can be tied together. In other applications the wired-OR is not used. In either case an external 50 Ω pull down resistor to –2 V or an equivalent network must be used to provide a LOW at the output when it is off.

ABSOLUTE MAXIMUM RATINGS (above which the useful life may be impaired)

Storage Temperature	–65°C to +150°C
Temperature (Ambient) Under Bias	–55°C to +125°C
V_{EE} Pin Potential to Ground Pin	–7.0 V to +0.5 V
Input Voltage (dc)	V_{EE} to +0.5 V
Output Current (dc Output HIGH)	–30 mA to +0.1 mA

GUARANTEED OPERATING RANGES

PART NUMBER	SUPPLY VOLTAGE (V_{EE})			AMBIENT TEMPERATURE
	MIN	TYP	MAX	See Note 4
F10415DC, F10415ADC	–5.46 V	–5.2 V	–4.94 V	0°C to 75°C
F100415DC	–5.7 V	–4.5 V	–4.2 V	0°C to 85°C

10415 and 10415A Only
DC CHARACTERISTICS: V_{EE} = –5.2 V, Output Load = 50 Ω and 30 pF to –2.0 V, T_A = 0°C to 75°C (Note 4)

I_{IL}	Input Current LOW, $\overline{CS}$	0.5		170	μA	+25°C	$V_{IN} = V_{ILB}$	
	All others	–50						
I_{EE}	Power Supply Current		–90		mA	+75°C	All Inputs and Outputs Open	
	(Pin 8)	–150	–105			0°C		

NOTES:
1. Conditions for testing, not shown in the tables are chosen to guarantee operation under "worst case" conditions.
2. The specified Limits represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
3. Typical values are at V_{EE} = –5.2V for F10415/10415A, V_{EE} = –4.5V for F100415, T_A = 25°C and maximum loading.
4. Guaranteed with transverse air flow exceeding 400 linear F.P.M. and 2-minute warm-up period. Typical resistance values of the package are:
   θ_{JA} (Junction to Ambient) = 90°C/Watt (still air)
   θ_{JA} (Junction to Ambient) = 50°C/Watt (at 400 F.P.M. air flow)
   θ_{JC} (Junction to Case) = 25°C/Watt
5. The maximum address access time is guaranteed to be the worst case bit in the memory using a pseudorandom testing pattern.
6. DEFINITION OF SYMBOLS AND TERMS USED IN THIS DATA SHEET:
   The symbols and terms used in this data sheet have been chosen to agree with the latest standards of the Electronics Industries Association and the International Electrotechnical Commission. The relative values of the specified conditions and limits will be referenced to an algebraic scale. The extremities of the scale are: "A" the value closest to positive infinity, "B" the value closest to negative infinity.

TTL ISOPLANAR MEMORY

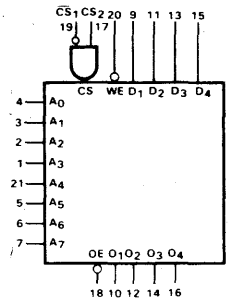
256 x 4-BIT FULLY DECODED RANDOM ACCESS MEMORY

DESCRIPTION - The 93422 and 93L422 are 1024-bit Read/Write Access Memories organized 256 words by four bits per words by four bits per word. The devices 3-state outputs, and is designed primarily for buffer control storage and high performance main memory applications.

- **ISOPLANAR TECHNOLOGY**
- **ORGANIZED — 256 WORDS X 4 BITS**
- **3-STATE OUTPUTS**
- **STANDARD 22-PIN DUAL & IN-LINE PACKAGE**
- **TWO CHIP SELECT INPUTS PROVIDE EASY MEMORY EXPANSION**
- **POWER DISSIPATION: 93L422 .027m W/BIT 93422 .045m W/BIT**

TYPICAL READ ACCESS TIME: 93L422 — 45ns 93422 — 30ns

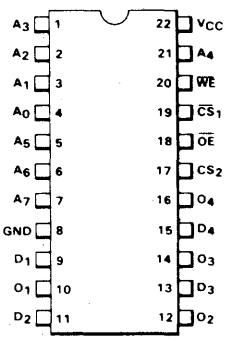
PIN NAMES



$A_0 - A_7$	Address Inputs
$D_1 - D_4$	Data Inputs
$\overline{CS}_1$, CS_2	Chip Select Inputs
$\overline{WE}$	Write Enable Input
$O_1 - O_4$	Data Outputs
$\overline{O}_E$	Output Enable

ABSOLUTE MAXIMUM RATINGS (above which the useful life may be impaired)

Storage Temperature	−65°C to +150°C
Temperature (Ambient) Under Bias	−55°C to +125°C
V_{CC} Pin Potential to Ground Pin	−0.5 V to +7.0 V
*Input Voltage (dc)	−0.5 V to +5.5 V
*Input Current (dc)	−12 mA to +5.0 mA
**Voltage Applied to Outputs (output HIGH)	−0.5 V to +5.50 V
Output Current (dc)	+20 mA



*Either Input Voltage limit or Input Current limit is sufficient to protect the inputs.
**Output Current Limit Required.

FAIRCHILD

FUNCTIONAL DESCRIPTION – The 93422 is a fully decoded 1024-bit Random Access Memory organized 256 words by four bits. Word selection is achieved by means of an 8-bit address, A_0 thru A_7. Two Chip Select inputs are provided for logic flexibility. For larger memories, the fast chip select access time permits the decoding of Chip Select, CS, from the address without increasing address access time. The read and write operations are controlled by the state of the active LOW Write Enable, WE (pin 20). With WE held LOW and the chip selected, the data at D_{IN} is written into the addressed location. To read, WE is held HIGH and the chip selected. Data in the specified location is presented at D_{OUT}.

NOTES:

1. Conditions for testing, not shown in the Table, are chosen to guarantee operation under "worst case" conditions.
2. The specified LIMITS represents the "worst case" value for the parameters. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
3. Typical values are at V_{CC} = 5.0 V, T_A = +25°C, and MAX loading.
4. The Temperature Ranges are guaranteed with transverse air flow exceeding 400 linear feet per minute. For military range an additional requirement of a two minute warm-up. Temperature range of operation refers to case temperature for Flatpaks and ambient temperature for all other packages. Typical thermal resistance values of the package at maximum temperature are:
   θ_{JA} (Junction to Ambient) (at 400 fpm air flow) = 50°C/Watt, Ceramic DIP; 65°C/Watt, Plastic DIP; NA, Flatpak.
   θ_{JA} (Junction to Ambient) (still air) = 90°C/Watt, Ceramic DIP; 110°C/Watt, Plastic DIP; NA, Flatpak.
   θ_{JC} (Junction to Case) = 25°C/Watt, Ceramic DIP; 25°C/Watt, Plastic DIP; 10°C/Watt, Flatpak.
5. The MAX address access time is guaranteed to be the "worst case" bit in the memory using a pseudo random testing pattern.
6. t_W measured at t_{WSA} = MIN, t_{WSA} measured at t_W = MIN.
7. Duration of short circuit should not exceed one second.

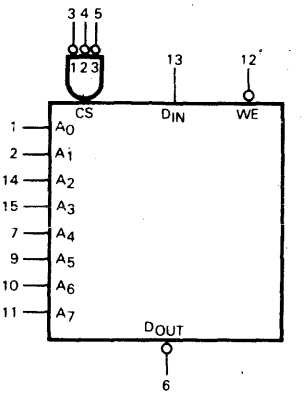
TTL ISOPLANAR MEMORY

256 x 1-BIT FULLY DECODED RANDOM ACCESS MEMORY



DESCRIPTION — These devices are high speed 256-bit TTL Random Access Memories with full decoding on chip. They are organized 256 words by one bit and are designed for scratchpad, buffer and distributed main memory applications. The devices have three Chip Select lines to simplify their use in larger memory systems. Address input pin locations are specifically chosen to permit maximum packaging density and for ease of PC board layout. A 3-state output is provided to drive bus organized systems and/or highly capacitive loads. The 93L420 and 93L421 are appropriate for systems requiring low power.

- **3-STATE OUTPUT**
- **REPLACEMENT FOR 54/74S200 AND EQUIVALENT DEVICES**

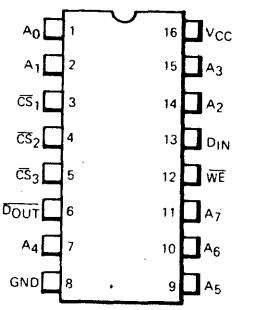
PIN NAMES		LOADING (Notes a, b)
$\overline{CS}_1$, $\overline{CS}_2$, $\overline{CS}_3$	Chip Select Inputs	0.5 U.L.
$A_0 - A_7$	Address Inputs	0.5 U.L.
D_{IN}	Data Input	0.5 U.L.
$\overline{D_{OUT}}$	Data Output	10 U.L.
$\overline{WE}$	Write Enable	0.5 U.L.



NOTES:
a. 1 Unit Load (U.L.) = 40 μA HIGH / 1.6 mA LOW
b. 10 U.L. is the output LOW drive factor. This output will sink a maximum of 16 mA at V_{OUT} = 0.45 V, and will source a minimum of 10 mA at 2.4 V.

MEMORY

©IC MASTER 1979

FUNCTIONAL DESCRIPTION — These devices are fully decoded 256-bit Random Access Memory organized 256 words by one bit. Word selection is achieved by means of an 8-bit address, A_0 thru A_7.

Three Chip Select inputs are provided for logic flexibility. For larger memories, the fast chip select access time permits the decoding of Chip Select, $\overline{CS}$, from the address without increasing address access time.

The read and write operations are controlled by the state of the active LOW Write Enable ($\overline{WE}$, pin 12). With $\overline{WE}$ held LOW and the chip selected, the data at D_{IN} is written into the addressed location. To read, $\overline{WE}$ is held HIGH and the chip selected. Data in the specified location is presented at $\overline{D_{OUT}}$.

The 3-state output provides drive capability for higher speeds with high capacitive load systems. The third state (high impedance) allows bus organized systems where multiple outputs are connected to a common bus.

During writing, the output is held in the high impedance state.

NOTES:

1. Conditions for testing, not shown in the Table, are chosen to guarantee operation under "worst case" conditions.
2. The specified LIMITS represents the "worst case" value for the parameters. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
3. Typical values are at V_{CC} = 5.0 V, T_A = 25°C, and MAX loading.
4. The Temperature Ranges are guaranteed with transverse air flow exceeding 400 linear feet per minute. For military range an additional requirement of a two minute warm-up. Temperature range of operation refers to case temperature for Flatpaks and ambient temperature for all other packages. Typical thermal resistance values of the package at maximum temperature are

   θ_{JA} (Junction to Ambient) (at 400 fpm air flow) = 50°C/Watt, Ceramic DIP; 65°C/Watt, Plastic DIP; NA, Flatpak.
   θ_{JA} (Junction to Ambient) (still air) = 90°C/Watt, Ceramic DIP; 110°C/Watt, Plastic DIP; NA, Flatpak.
   θ_{JC} (Junction to Case) = 25°C/Watt, Ceramic DIP; 25°C/Watt, Plastic DIP; 10°C/Watt, Flatpak.

5. The MAX address access time is guaranteed to be the "worst case" bit in the memory using a pseudo random testing pattern.
6. t_W measured at t_{WSA} = MIN, t_{WSA} measured at t_W = MIN.
7. Duration of short circuit should not exceed one second.

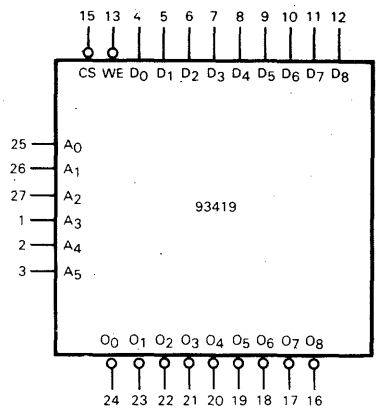
TTL ISOPLANAR MEMORY 93419

64×9-BIT FULLY DECODED RANDOM ACCESS MEMORY



DESCRIPTION – The 93419 is a 576-bit Read/Write Random Access Memory organized 64 words by nine bits per word with uncommitted collector outputs. It is ideally suited for scratchpad, small buffer and other applications where the number of required words is small and where the number of required bits per word is relatively large. The ninth bit can provide parity for 8-bit word systems.

- **UNCOMMITTED COLLECTOR OUTPUTS**
- **TTL INPUTS AND OUTPUTS**
- **ISOPLANAR TECHNOLOGY**
- **ORGANIZATION – 64 WORDS X 9 BITS**
- **STANDARD 28-PIN DUAL IN-LINE PACKAGE**
- **DATA OUTPUT IS THE COMPLEMENT OF DATA INPUT**
- **POWER DISSIPATION – 1.3 mW/BIT**

FAIRCHILD

FUNCTIONAL DESCRIPTION – The 93419 is a fully decoded 576-bit Random Access Memory organized 64 words by nine bits. Word selection is achieved by means of a 6-bit address, A_0 to A_5.

The Chip Select input provides for memory array expansion. For large memories, the fast chip select access time permits the decoding of chip select ($\overline{CS}$) from the address without affecting system performance.

The read and write operations are controlled by the state of the active LOW Write Enable ($\overline{WE}$, pin 13). With $\overline{WE}$ held LOW and the chip selected, the data at D_{IN} is written into the addressed location. To read, $\overline{WE}$ is held HIGH and the chip selected. Data in the specified location is presented at $\overline{D_{OUT}}$ and is inverted from Data In to Data Out.

Uncommitted collector outputs are provided to allow maximum flexibility in output connection. In many applications such as memory expansion, the outputs of many 93419s can be tied together. In other applications the wired-OR is not used. In either case an external pull-up resistor of R_L value must be used to provide a HIGH at the output when it is off. Any R_L value within the range specified below may be used.

$$\frac{V_{CC(MAX)}}{I_{OL} - FO\ (1.6)} \leqslant R_L \leqslant \frac{V_{CC}\ (MIN) - V_{OH}}{n\ (I_{CEX}) + FO\ (0.04)}$$

R_L is in kΩ (limited to 8 mA)
n = number of wired-OR outputs tied together
FO = number of TTL Unit Loads (UL) driven
I_{CEX} = Memory Output Leakage Current
V_{OH} = Required Output HIGH Level at Output Node
I_{OL} = Output LOW Current

The minimum R_L value is limited by output current sinking ability. The maximum R_L value is determined by the output and input leakage current which must be supplied to hold the output at V_{OH}. One Unit Load = 40 μA HIGH/1.6 mA LOW. FO_{MAX} = 5 UL.

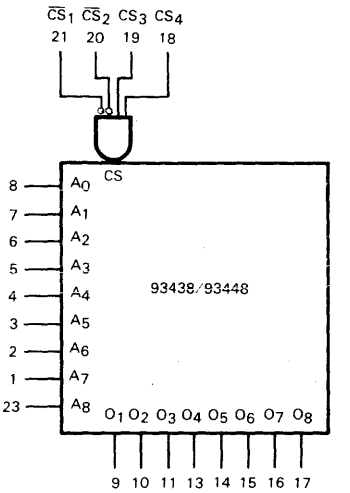
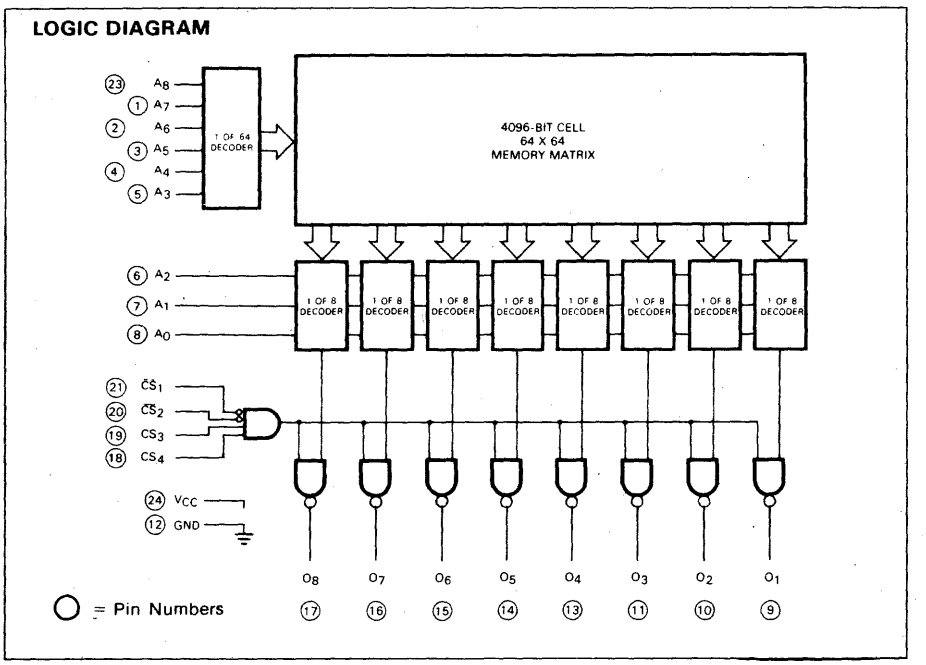
93438/93448
ISOPLANAR SCHOTTKY TTL MEMORY
512×8-BIT PROGRAMMABLE READ ONLY MEMORY



DESCRIPTION – The 93438 and 93448 are fully decoded 4096-bit field Programmable ROMs organized 512 words by eight bits per word. The devices are identical except for the output stage. The 93438 has uncommitted collector outputs, while the 93448 has 3-state outputs. Either device is enabled when $\overline{CS}_1$ and $\overline{CS}_2$ are LOW and CS_3 and CS_4 are HIGH. The 93438/48 is supplied with all bits stored as logic "1's" and may be programmed to logic "0's" by following the field programming procedure.

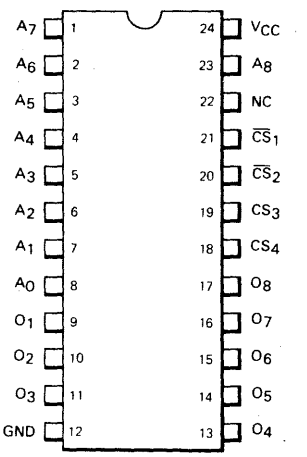
- FAST CYCLE TIME – 35ns TYP
- FULL MIL AND COMMERCIAL RANGES
- FIELD PROGRAMMABLE
- ORGANIZATION – 512 WORDS X 8 BITS
- UNCOMMITTED COLLECTORS – 93438
- 3-STATE OUTPUTS – 93448
- FULLY DECODED – ON-CHIP ADDRESS DECODER AND BUFFER
- CHIP SELECT INPUTS PROVIDE EASY MEMORY EXPANSION
- WIRED-OR CAPABILITY
- STANDARD 24-PIN DUAL IN-LINE PACKAGE
- NICHROME FUSE LINKS FOR HIGH RELIABILITY

PIN NAMES



$\overline{A_0} - \overline{A_8}$	Address Inputs
$\overline{CS}_1, \overline{CS}_2, CS_3, CS_4$	Chip Select Inputs
$O_1 - O_8$	Data Outputs

LOGIC SYMBOL



V_{CC} = Pin 24
GND = Pin 12

LOGIC DIAGRAM

CONNECTION DIAGRAM
DIP (TOP VIEW)

NOTE: The Flatpak version has the same pinouts (Connection Diagram) as the Dual In-line Package.

X = package type; F for Flatpack, D for Ceramic Dip, P for Plastic Dip. See Packaging Information Section for packages available on this product.

FUNCTIONAL DESCRIPTION — The 93450 and 93451 are bipolar field Programmable Read Only Memories (PROMs) organized 1024 words by eight bits per word. Open Collector outputs are provided on the 93450 for use in wired-OR systems. The 93451 has 3-state outputs which provide active pull-ups when enabled and high output impedance when disabled. Chip Select for both devices follows the logic equation: $\overline{CS}_1 \bullet \overline{CS}_2 \bullet CS_3 \bullet CS_4 = CS$; i.e., if $\overline{CS}_1$ and $\overline{CS}_2$ are both active LOW and CS_3 and CS_4 are both active HIGH, all eight outputs are enabled; for any other condition all eight outputs are disabled.

The read function is identical to that of a conventional bipolar ROM. That is, a binary address is applied to the A_0 through A_9 inputs, the chip is selected, and data is valid at the outputs after t_{AA} nanoseconds.

Programming (selectively opening nichrome fuse links) is accomplished by following the sequence outlined under the table of PROGRAMMING SPECIFICATIONS.

PROGRAMMING — The 93450 and 93451 are manufactured with all bits in the logic "1" state. Any desired bit (output) can be programmed to a logic "0" state by following the procedure shown below. One may build a programmer to satisfy the specifications or purchase any of the commercially available programmers which meet these specifications.

PROGRAMMING SPECIFICATIONS

PARAMETER	SYMBOL	MIN	RECOMMENDED VALUE	MAX	UNITS	COMMENTS	
Address Input	V_{IH}	2.4	5.0	5.0	V	Do not leave inputs open	
	V_{IL}	0	0	0.4	V		
Chip Select	$\overline{CS}_1$, $\overline{CS}_2$	2.4	5.0	5.0	V	Pin 20 or 21 or both	Either or both

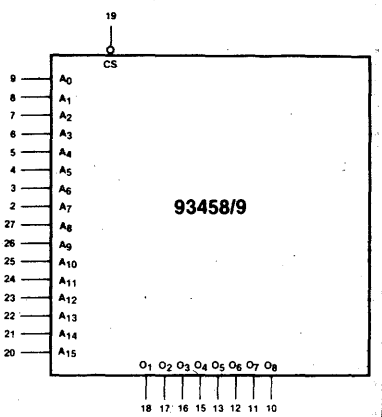
93458/93459
ISOPLANAR SCHOTTKY TTL FPLA
16 × 48 × 8 FIELD PROGRAMMABLE LOGIC ARRAY

DESCRIPTION — The 93458 and 93459 are high-speed bipolar field Programmable Logic arrays organized with 16 inputs, 48 product terms and 8 outputs. The 16 inputs and their complements are fuse linked to the inputs of 48 AND gates (48 product terms). Each of the 48 AND gates are fuse linked to 8 48-input OR gates (8 summing terms). Each output may be programmed active HIGH or active LOW. The devices are identical except for the output stage. The 93458 has uncommitted collector outputs while the 93459 has 3-state outputs. In either case, the outputs are enabled when $\overline{CS}$ is LOW.

- **FIELD PROGRAMMABLE (NICHROME FUSE LINKS)**
- **FULL MIL AND COMMERCIAL RANGES**
- **FAST CYCLE TIME — 25 ns TYP**
- **ORGANIZATION — 16 INPUTS x 48 PRODUCT TERMS x 8 OUTPUTS**
- **UNCOMMITTED COLLECTOR OUTPUTS — 93458**
- **3-STATE OUTPUTS — 93459**
- **CHIP SELECT PROVIDES EASY MEMORY EXPANSION**
- **28-PIN PACKAGE**



ABSOLUTE MAXIMUM RATINGS

Storage Temperature	-65°C to +150°C

LOGIC RELATIONSHIPS

Input Term A_n — $n = 0, \ldots, 15$, one of 16 inputs

Product Term $P_m = \Pi_0^{15} (i_n A_n + j_n \overline{A_n})$ — $m = 0, \ldots, 47$, one of 48 product terms where:
a) $i_n = j_n = 0$ for unprogrammed input
b) $i_n = \overline{j_n}$ for programmed input
c) $i_n = j_n = 1$ for don't care input

$F_r = \Sigma_0^{47} P_m$ — $r = 1, \ldots, 8$, the OR function of the 48 products terms

Summing Term $S_r = \Sigma_0^{47} k_m P_m$ — where $k_m = 0$ for product term inactive (programmed)
$k_m = 1$ for product term active (unprogrammed)

MODE	$\overline{CS}$	F_r	S_r	OUTPUT ACTIVE HIGH	OUTPUT ACTIVE LOW
READ	0	1	0	0	1
	0	1	1	1	0
	0	0	X	0	1
DISABLE	1	X	X	1 (93458)	1 (93458)
	1	X	X	HI Z (93459)	HI Z (93459)

Example — By programming, the 8 outputs of an FPLA can be made to relate to the 16 inputs as given by the following example:

8 outputs total

$$O_1 = A_0 \overline{A_6} A_{14} + \overline{A_2}\,\overline{A_{15}} + \underbrace{\overline{A_0} A_1 \ldots A_{15}}_{\text{16 input terms max}} + \overline{A_8} A_{10} \overline{A_{13}}$$

48 product terms max

$O_2 = A_0 \overline{A_6} A_{14} + \overline{A_2}\,\overline{A_{15}}$ (Output polarity programmed, active high.)

.
.
.

$$O_8 = \overline{(\overline{A_8} A_{10} \overline{A_{13}} + A_4 \overline{A_7} \overline{A_9} A_{11} \overline{A_{12}})}$$ (Output polarity not programmed, active low.)

FUNCTIONAL DESCRIPTION — The 93458 and 93459 are bipolar field Programmable Logic Arrays (FPLA) organized 16 inputs by 48 product terms by 8 outputs. Open collector outputs are provided on the 93458 for use in wired-OR systems. The 93459 has 3-state outputs which provide active pull ups when enabled and high output impedance when disabled. Chip Select for both devices is active LOW; i.e., a HIGH (logic "1") on the $\overline{CS}$ pin will disable all outputs.

The read function is identical to that of a conventional bipolar ROM. That is, a binary address is applied to the A_0 through A_{15} inputs, the chip is selected, and data is valid at the outputs after t_{AA} nanoseconds.

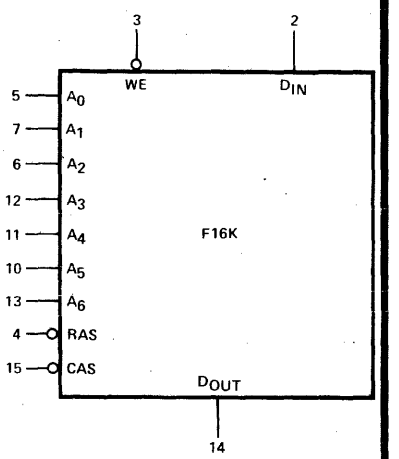
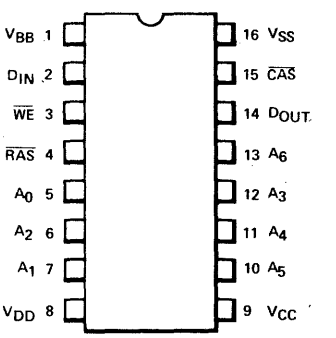
F16K



16,384 x 1 DYNAMIC RANDOM ACCESS MEMORY

FAIRCHILD ISOPLANAR SILICON GATE MOS

GENERAL DESCRIPTION — The F16K is a 16,384-bit MOS Dynamic Random Access Memory configured as 16,384 one-bit words, and which is manufactured using Fairchild's n-channel silicon gate, double-poly Isoplanar process. The use of the single-transistor memory cell along with address multiplexing techniques permits the packaging of the F16K in a standard 16-pin dual in-line package. The use of this package allows construction of highly dense memory systems utilizing widely available automated testing and insertion equipment. Furthermore, the pinout, timing and organizational characteristics of the F16K are essentially the same 16-pin 4K dynamic RAMs. Thus the F16K is ideally suited for easy upgrading of 4K-RAM-based systems.



- INDUSTRY STANDARD 16-PIN DUAL IN-LINE PACKAGE
- LOW CAPACITANCE, TTL-COMPATIBLE INPUTS (INCLUDING CLOCKS)
- ON-CHIP ADDRESS AND INPUT DATA LATCHES
- 3-STATE TTL-COMPATIBLE OUTPUT WITH DATA VALID TIME CONTROLLED BY $\overline{CAS}$
- COMMON I/O CAPABILITY
- TWO DIMENSIONAL SELECTION BY DECODING BOTH $\overline{RAS}$ AND $\overline{CAS}$
- STANDARD 10% SUPPLIES (+12 V, +5 V, and −5 V)
- FLEXIBLE TIMING WITH PAGE-MODE AND EXTENDED PAGE BOUNDARIES
- 128-CYCLE $\overline{RAS}$-ONLY REFRESH
- PINOUT AND SPECIFICATION COMPATIBLE WITH INDUSTRY-STANDARD 16K RAMs

FUNCTIONAL DESCRIPTION

ADDRESSING – The 14 address bits required to decode one-of-16, 384 cell locations in the F16K are entered using a 2-phase multiplexing operation in which first the 7-bit Row Address is entered followed by the 7-bit Column Address. First the 7-bit Row Address is applied to the seven address inputs of the F16K and latched into the chip by Row Address Strobe ($\overline{RAS}$) which is the first of two externally applied TTL-level clocks. The second clock, Column Address Strobe ($\overline{CAS}$), subsequently latches the seven column address bits into the chip. Each of these signals $\overline{RAS}$ and $\overline{CAS}$, trigger on-chip clock generators which control the internal sequencing of events on the chip. Advanced techniques used in handling the row and column address information allow the address multiplexing operation to be performed without lengthening the critical timing path governing the access time. The activation of $\overline{CAS}$ strobes the column address latch but this event as well as other internal events governed by the $\overline{CAS}$ clock generator may be inhibited until certain prerequisite events controlled by the $\overline{RAS}$ clock generator have occured.

More specifically, a "window" of time exists, extending from $t_{RCD(min)}$ to $t_{RCD(max)}$ during which $\overline{CAS}$ may become active without impacting the access time. Stated another way, as long as $\overline{CAS}$ occurs during this window, the access time will be specified by t_{RAC}. If $\overline{CAS}$ occurs a certain delay after this window of time, the $\overline{RAS}$ clock generator no longer inhibits the $\overline{CAS}$ clock generator and the magnitude of this delay will add directly to the overall access time. This lengthened access time is now referenced to $\overline{CAS}$ rather than $\overline{RAS}$ and is lengthened by the amount of time that t_{RCD} exceeds the $t_{RCD(max)}$ limit. This "gated-$\overline{CAS}$" feature allows greater flexibility since the $\overline{CAS}$ clock may be externally activated as soon as the Hold Time for the Row Address has been met and the address inputs have been changed from Row Address to Column Address information.

PAGE MODE OPERATION – The Page-Mode feature of the F16K allows successive memory cycles accessing the same row in the memory matrix to be concatenated together in such a way that the common Row Address need be supplied only once - resulting in faster access times with no corresponding increase in power. The page-mode option may be used in conjunction with any of the defined memory operations, and is accomplished by supplying the Row Address to the chip and holding $\overline{RAS}$ LOW throughout all subsequent memory cycles for which the Row Address is common.

Since $\overline{RAS}$ makes its initial negative transition only once, no additional dynamic power is dissipated due to $\overline{RAS}$ on any subsequent cycles performed within that row. The access and cycle times are also shortened since the time required to supply a Row Address is eliminated.

DATA INPUT – In a write operation, the data to be input into memory is strobed into an on-chip register during $\overline{RAS}$ by a combination of $\overline{CAS}$ and Write Enable ($\overline{WE}$). The strobe is formed by whichever is the latter of these two signals to make its negative transistion. This presents several possibilities in how a write cycle may be performed. In an "early-write" cycle ($\overline{WE}$ active LOW before $\overline{CAS}$ goes LOW), Data In (D_{IN}) is strobed by $\overline{CAS}$ and thus the set-up and hold times are referenced to this signal edge. If D_{IN} is not yet valid at the time $\overline{CAS}$ becomes active (or if the cycle is a read-write or read-modify-write) then $\overline{WE}$ must be delayed. In this delayed-write mode, the D_{IN} set-up and hold times are referenced to $\overline{WE}$ rather than $\overline{CAS}$. (See the timing diagrams).

DATA OUTPUT – The Data Out (D_{OUT}) latch and buffer unconditionally assume the high-impedance state whenever $\overline{CAS}$ is HIGH, i.e. inactive. If the cycle being performed is a read, read-modify-write, or a delayed write cycle then the D_{OUT} latch and buffer will remain high impedance until the access time, after which D_{OUT} will assume the value of the data read from the selected cell. This output data is of the same polarity (not inverted) as the input data and will remain valid as long as $\overline{CAS}$ is kept active, i.e. LOW. However, if the cycle is an "early-write" cycle or if the chip fails to receive both $\overline{RAS}$ and $\overline{CAS}$, then D_{OUT} will remain high impedance throughout the cycle. This feature allows systems which write employing the early write mode exclusively, to common D_{IN} and D_{OUT} directly together.

Another advantage of this "unlatched output" feature is that OR-tied outputs in a memory matrix require no special action to be turned off. Unlike other types of RAMs which require a negative transition of $\overline{CAS}$ to become high impedance, the F16K's output is already high impedance whenever $\overline{CAS}$ is HIGH, i.e. inactive. This means that $\overline{CAS}$ need not be supplied to unused devices and therefore may be used for device selection. Thus a reduction in external decoding logic is possible by using both $\overline{RAS}$ and $\overline{CAS}$ in a 2 dimensional decoding/selection scheme. (see Table 1 below).

$\overline{RAS}$ active during cycle?	$\overline{CAS}$ active during cycle?	RESULT (after t_{OFF} delay)
Yes	Yes	Device active
Yes	No	Device deselected, refresh
No	Yes	Device deselected
No	No	Device deselected

TABLE 1

EXTENDED PAGE BOUNDARY – A further implication of using both $\overline{RAS}$ and $\overline{CAS}$ for device decoding/selection is in extending page boundaries for page-mode operation. If only $\overline{RAS}$ is decoded, then any given "page" is limited to only 128 different column addresses within that page, (i.e. seven column address bits correspond to $2^7 = 128$ column addresses). Therefore, for memory systems using more than 16K words of data, page boundaries may be extended from 128 addresses per page up to any multiple of 128 addresses merely by decoding which 16K memory bank also gets a $\overline{CAS}$

©IC MASTER 1979

(subject to $t_{RAS(max)}$ limitation). This is accomplished by supplying $\overline{RAS}$ to all devices in order to latch in the Row Address information and then decoding which bank of 16K words is to also get $\overline{CAS}$. Only those devices which receive both $\overline{RAS}$ and $\overline{CAS}$ will respond with a valid memory cycle.

INPUT/OUTPUT LEVELS – All inputs, including the two address strobes, interface directly with TTL. The high-impedance, low-capacitance input characteristics simplify input driver selection by allowing use of standard logic elements rather than specially designed driver elements. Termination resistors are normally required in a system to prevent ringing due to line inductance and reflections. In high-speed memory systems, transmission line techniques must be employed on the signal lines to achieve optimum system speeds. Series termination may be employed at some degradation of system speed.

The 3-state output buffer is a low impedance to V_{CC} for logic "1" and low impedance to V_{SS} for logic "0". The effective resistance to V_{CC} is 420 Ω maximum and 135 Ω typically. The effective resistance to V_{SS} is 95 Ω maximum and 35 Ω typically.

REFRESH – The matrix of 128 X 128 memory cells in the F16K is refreshed by executing a memory cycle at each of the 128 Row Addresses within each interval of 2 milliseconds or less. Although any cycle in which $\overline{RAS}$ occurs accomplishes a refresh operation, the refresh is most easily accomplished in the $\overline{RAS}$-only-refresh mode. This type of refresh operation results in decreased power dissipation since $\overline{CAS}$ remains inactive.

POWER DISSIPATION/STANDBY – Since the F16K uses dynamic memory cells, this means that most of the dissipated power is a result of an address strobe edge. There is, however, a small dc component of dissipated power that is associated with the precharging of the sense amplifiers. Thus, the total power dissipated is a function of both operating frequency and duty cycle. Typically, the power is 350 mW at 1μs cycle time with a worst case power of less than 462 mW at 375 μs cycle time. To reduce overall system power during standby, $\overline{RAS}$-only-refresh cycles should be performed with $\overline{CAS}$ held HIGH.

The V_{CC} supply is not used in the internal memory operations of the F16K, but rather used only at the output buffer and thus, for some applications, may be powered from the supply voltage of the logic to which the chip's output is interfaced. This means that I_{CC}, the current drawn from the V_{CC} supply, is a function of output loading. During battery standby operation, the V_{CC} pin may be unpowered, if desired, without affecting the refresh operation. This allows all system logic, except the $\overline{RAS}$ timing circuitry and the refresh address logic, to be turned off during battery standby to conserve power.

PIN NAMES

A_n	Address Inputs	D_{OUT}	Data Output
D_{IN}	Data Input	V_{CC}	+5 V Power Supply
$\overline{WE}$	Write Enable Input (Active LOW)	V_{SS}	0 V Power Supply
$\overline{RAS}$	Row Address Strobe (Clock) Input (Active LOW)	V_{BB}	−5 V Power Supply
$\overline{CAS}$	Column Address Strobe (Clock) Input (Active LOW)	V_{DD}	+12 V Power Supply

ABSOLUTE MAXIMUM RATINGS

Voltage of any pin relative to V_{BB} ($V_{SS} - V_{BB} \geq 4.5$ V)	−0.5 V to + 20 V
Operating Temperature (Ambient)	0°C to 70°C
Storage Temperature (Ambient)	−55°C to 150°C
Power Dissipation	1 W

Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

2102 • 2102L • 21L02

1024 X 1 STATIC RANDOM ACCESS MEMORY

FAIRCHILD ISOPLANAR SILCON GATE MOS INTEGRATED CIRCUIT

GENERAL DESCRIPTION — The 2102 family consists of 1024-word by 1-bit Static Random Access Read/Write Memories which requires only a single 5 V supply, have fully TTL compatible inputs and output, and require no clocking or refresh. Chip Select (CS) permits a 3-state output allowing the outputs to be wired-OR. Special features include low power dissipation (2102L) and a power-down capability (21L02).

The 2102, 2102L and 21L02 series are manufactured employing the n-channel Isoplanar process and are available in a 16-pin dual in-line package or flatpak.

- **FAST ACCESS – 250 ns**
- **SINGLE +5 V SUPPLY**
- **TTL COMPATIBLE INPUTS AND OUTPUT**
- **TOTALLY STATIC – NO CLOCKS OR REFRESH**
- **3-STATE OUTPUT**
- **LOW POWER (2102L)**
- **POWER-DOWN CAPABILITY (21L02)**
- **FULLY EXPANDABLE**
- **FULLY DECODED**
- **16-PIN DUAL IN-LINE PACKAGE**

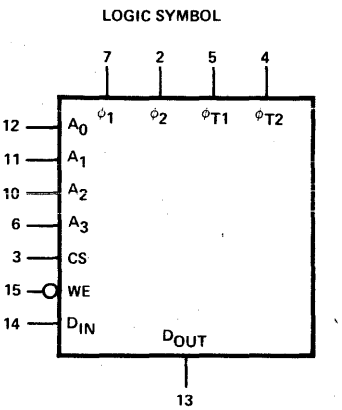
F464

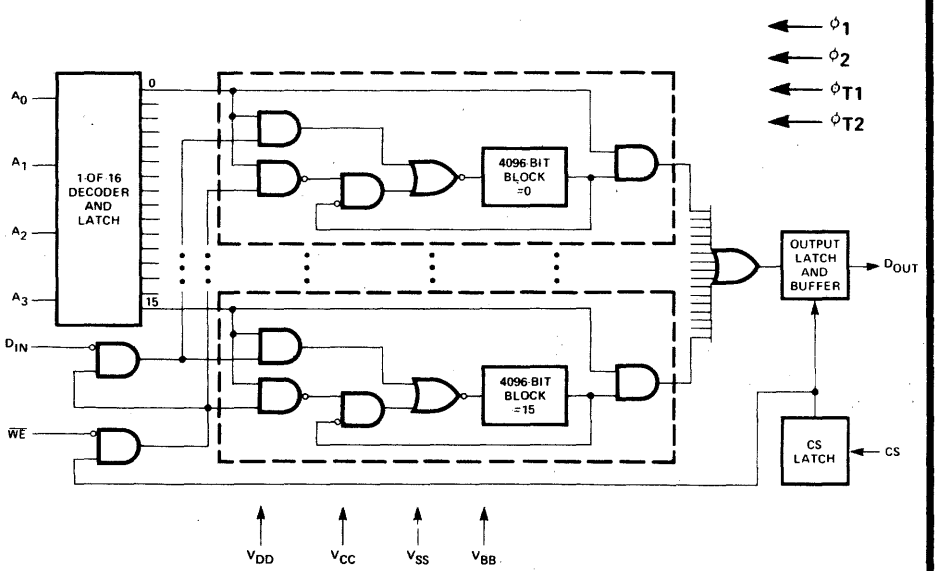
65,536 X 1 DYNAMIC SERIAL MEMORY



FAIRCHILD CHARGE COUPLED DEVICE

GENERAL DESCRIPTION – The F464 is a 65,536-bit dynamic serial memory configured as 16 randomly accessible shift registers, each 4096 bits long. Each of these shift registers is designed utilizing Charge Coupled Device (CCD) techniques with the interlaced Serial-Parallel-Serial (SPS) register structure which features both low power and high density characteristics. The high density of the F464 is further enhanced through the use of an electrode-per-bit memory cell approach. The high density permits packaging the memory in a standard 16-pin (0.3"-wide) dual in-line package which allows the construction of highly dense memory systems using widely available automated testing and insertion equipment.

Furthermore, this buried-channel CCD memory is fabricated using Fairchild's double-poly n-channel Isoplanar process. This process allows the F464 to be a high performance, state-of-the-art memory circuit which is manufacturable in large volume.



- **INDUSTRY STANDARD 16 PIN (0.3"-WIDE) DUAL IN-LINE PACKAGE.**
- **OPERATING FREQUENCY RANGE: 1 MHz TO 5 MHz.**
- **15 μs HALT TIME AT 2.0 MHz**
- **LOW CAPACITANCE TTL-COMPATIBLE INPUTS (EXCEPT CLOCKS).**
- **3-STATE, TTL-COMPATIBLE, LATCHED DATA OUTPUT.**
- **OUTPUT DRIVE CAPABILITY: 3.5 mA**
- **LOW CAPACITANCE 12 V CLOCKS:**
  - **ϕ_1 AND ϕ_2: 100 pF (TYP)**
  - **ϕ_{T1} AND ϕ_{T2}: 30 pF (TYP)**
- **LOW POWER**
  - **NORMAL OPERATION: <336 mW (MAX) @ f_{max}**
  - **STANDBY: <66 mW (MAX) @ f_{min}**
- **STANDARD POWER SUPPLIES (+12 V, +5 V, AND −5 V)**

FUNCTIONAL DESCRIPTION

ORGANIZATION – The F464 is a 65,536 x 1 bit dynamic serial memory organized internally as 16 dynamic shift registers (or blocks) of 4096 bits each in length. These 16 shift register blocks are randomly accessible through four internally decoded Address inputs (A_0 – A_3). When a given register is selected, its input and output are internally connected (as needed) to the D_{IN} and D_{OUT} pins, respectively, thus permitting simultaneous read and write operations.

ARCHITECTURE – Each of the sixteen shift register blocks is implemented using a Serial-Parallel-Serial (SPS) register architecture. In this approach N data bits are sequentially shifted into a "serial" input register. When full, the entire N-bit word is shifted in parallel into N "parallel" registers of M bits in length, as illustrated in Figure 1. At the other end of this parallel register structure, bits are loaded in parallel into an N-bit serial output register. Bits in this register are then shifted out toward the sense amplifier at the output and are automatically recirculated back to the input serial register unless a WRITE operation is specified.

The primary advantages of this type of architecture include very high density, low power, and low clock capacitance. These features all result from the fact that in the SPS architecture the parallel registers which encompass most of the total storage capacity within each block are shifted at a considerably slower rate (f_{IN}/N) than the clock rate of the input or output serial registers (f_{IN}).

In actuality, each 4096-bit block of the F464 is implemented using an "interlaced" SPS structure in which each bit of the input serial register services two parallel registers rather than just one. The same is true for the output serial register. In addition, "electrode-per-bit" design techniques are used to reduce the effective cell size by minimizing the number of electrodes used to store each bit of information. These techniques obviously enhance the memory density considerably. The dimensions of the F464's interlaced SPS structure are 32-bit input and output serial registers and 64 parallel registers, each 63 bits in length. See Figure 2. These dimensions were chosen in order to optimize the power/density/latency tradeoffs inherent in the CCD memory approach.

CLOCKS – The F464 requires four MOS level clocks: two high frequency (1 to 5 MHz) serial clocks and two low frequency transfer clocks. The serial clocks, ϕ_1 and ϕ_2, control the movement of data within the input and output serial registers of each 4096-bit block and have a frequency equal to the data rate. The transfer clock ϕ_{T1} is used to transfer data from the input serial register to the parallel registers while the transfer clock ϕ_{T2} is used to transfer data from the parallel registers to the output serial register of each block. The data present in the parallel registers is shifted by internally generated ripple clocks. This ripple clock technique allows a high bit-packing density approaching one electrode per bit.

To achieve proper transfer phasing, the two transfer clocks are asymetrical about a 32-cycle interval (31.5 and 32.5 cycles) but symmetrical about a 64-cycle interval. The phasing between these transfer clocks alternates in order to achieve correct bit storage in each block. When ϕ_{T1} occurs during ϕ_1 time, ϕ_{T2} occurs during ϕ_2 time 1.5 cycles prior to ϕ_{T1}. When ϕ_{T1} occurs during ϕ_2 time, ϕ_{T2} occurs during ϕ_1 time 2.5 cycles prior to ϕ_{T1}. Figure 3 illustrates the clock phase relationships.

The clocking operation may be momentarily halted for as long as 15 μs once each interval of 64 or more clock cycles provided that the clock frequency is at least 2.0 MHz or higher. During this "halt time" it is recommended that all clock signals be in the LOW state in order to limit power dissipation.

CONTROLS

In addition to the four Address inputs (A_0 through A_3), other TTL level control signals available on the F464 include Write Enable ($\overline{WE}$) and Chip Select (CS). The CS input, along with the address information, is presented during ϕ_1 HIGH time and dynamically latched with the trailing edge of ϕ_1 which simultaneously disables both the address and CS buffers. This action prevents changes that occur on the external pins from entering the internal circuitry when ϕ_1 is LOW. The $\overline{WE}$ control signal determines whether new data from the D_{IN} pin, or recirculated output data, is presented to the input of the addressed block. The non-addressed blocks are automatically recirculated.

MODES OF OPERATION

STANDBY (Recirculate-only cycle)

In Standby mode (CS LOW), the contents of all 16 blocks are recirculated automatically, and the device disregards the $\overline{WE}$, Address, and D_{IN} inputs. The output latch goes into the high impedance state after the trailing edge of the ϕ_1 clock. Minimum power dissipation results when the device is operated in the recirculate mode with minimum ϕ_1 and ϕ_2 pulse widths at the lowest allowed frequency.

READ-RECIRCULATE MODE

In this mode of operation ($\overline{WE}$ HIGH and CS HIGH) the data from the selected block is presented to the output buffer immediately following the leading edge of ϕ_2 and appears at the output, D_{OUT}, after a delay equal to the access time t_{ACC}. Thus, the access time is referenced from the leading edge of the ϕ_2 pulse and is independent of the duration of ϕ_2. The output data is latched and remains valid at the D_{OUT} pin until the end of the ϕ_1 clock pulse in the next cycle. The data present in all 16 blocks automatically recirculates from the output back to the input regardless of the address inputs, provided that $\overline{WE}$ remains inactive throughout the cycle.

READ AND WRITE MODE

In the Read and Write mode ($\overline{WE}$ LOW and CS HIGH), the output data from the selected block is available at the output pin as in the read-recirculate mode; however, the recirculate path of that particular block is disabled. Input data present at the D_{IN} pin during ϕ_2 is written into the selected block by the falling edge of ϕ_2, while the other 15 blocks automatically recirculate their contents. This form of an "early-write" cycle ($\overline{WE}$ LOW prior to the falling edge of ϕ_1) requires that both $\overline{WE}$ and D_{IN} have set-up times with respect to the trailing edge of ϕ_1. In fact, for successive write operations handled in this mode, $\overline{WE}$ may be held LOW continuously without returning it to the HIGH state between cycles. A "delayed-write" cycle ($\overline{WE}$ goes LOW after the trailing edge of the ϕ_1 clock pulse) is also possible and is discussed in the next paragraph as a subset of the RMW operating mode.

READ-MODIFY-WRITE MODE

The Read-Modify-Write mode (CS HIGH, $\overline{WE}$ HIGH goes LOW) is simplified by the fact that the F464 is always in the read mode whenever it is selected (CS HIGH). Since the access time is referenced to the leading edge of ϕ_2 and the setup times of $\overline{WE}$ and D_{IN} are referenced to the trailing edge of ϕ_2, this mode of operation requires an extended ϕ_2 HIGH time in order to provide the required modify time. This "stretched" ϕ_2 HIGH time may be determined by the following relationship:

$$t_{\phi 2H} = t_{ACC} + t_{MOD} + t_{DS} + t_{WCL} + t_T$$

The modify time, t_{MOD}, is determined by the user and is dependent on the delays of the external logic used to modify the output data. The Read-Modify-Write (RMW) cycle time then, is given by:

$$t_{CYC} = t_{\phi 1H} + t_{UL1} + t_{\phi 2H} + t_{UL2} + 4t_{TC}$$

where $t_{\phi 2H}$ is the new "stretched" version of the ϕ_2 clock pulse.

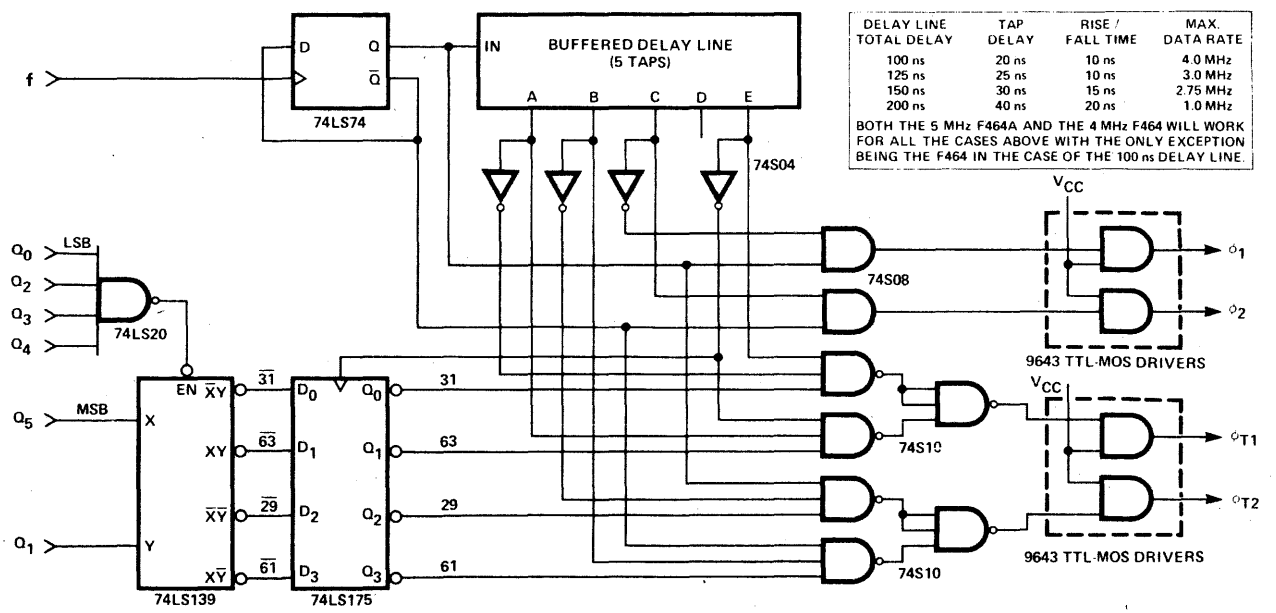
If no modification of output data is required, then this operating mode reduces to a "delayed-write" mode in which D_{IN} and $\overline{WE}$ may occur after the ϕ_1 clock pulse.

©IC MASTER 1979

MEMORY START-UP

When the F464 is initially powered up, the V_{BB} supply (i.e., the –5 volt supply) should be applied to the memory before and removed after the other supplies. This action results in greater protection against accidental violation of the voltage limits specified in the Absolute Maximum Ratings section and, in general, enhances the long term reliability of the memory.

In order to clear the memory of extraneous charge following power-up or after a clock stoppage of greater than 15 μs, the F464 must be clocked through a minimum of 20,000 clock cycles of any type before a valid memory cycle should be attempted.



CLOCK GENERATION CIRCUIT –

The circuit shown below may be used to generate the four MOS-level clocks required of the F464 from a single master clock. In this circuit, the master clock frequency f, must be twice the desired data rate at the F464 output pin. Since the input clock frequency is "squared-up" with a divide-by-two flip-flop, the duty cycle of this clock is non-critical. A pulse edge at the input of the buffered delay line produces a sequence of delayed pulse edges from the A, B, C, D and E output taps. These delayed pulse edges are ANDed together to produce the required ϕ_1 and ϕ_2 clocks as well as the ϕ_{T1} and ϕ_{T2} transfer clocks. Since the transfer clocks occur in a symmetrical fashion every 64 clock cycles, a 6-bit, modulo 64 counter is required. The outputs of this 6-bit counter are decoded to enable the appropriate transfer clock gates at counts of 29, 31, 61 and 63. Thus, ϕ_{T1} is passed along to the clock drivers only during cycles 31 and 63, while ϕ_{T2} is gated through only during cycles 29 and 61. These four counts are easily decoded with only a 2-to-4 decoder and one 4-input NAND gate. The 6 bits of the modulo 64 counter comprise the 6 low order bits of the 12-bit, modulo 4096 loop counter. This counter is required to define address locations within each 4K block and will, in most cases, be already present in the system.

One major advantage of using a delay line is that since the clock pulses are generated from delayed edges, the pulse width in all cases is fixed and does not vary as a function of the input master frequency f. Thus minimum pulse widths are always generated regardless of cycle and data rates. This translates directly into lower power dissipation since I_{DD} is a function of clock pulse width.

The maximum clock rates for which this circuit will operate properly depends on the clock transition times (both rise and fall) at the output of the TTL-to-MOS drivers and, the delay between adjacent taps on the delay line. The maximum data rates possible for this circuit are given in the table. Faster and/or more efficient clock generation circuits may be realized by using different types of delay lines (e.g. more taps or unequal tap delays).

SERIAL AND TRANSFER CLOCK GENERATION CIRCUIT

DELAY LINE TOTAL DELAY	TAP DELAY	RISE / FALL TIME	MAX. DATA RATE
100 ns	20 ns	10 ns	4.0 MHz
125 ns	25 ns	10 ns	3.0 MHz
150 ns	30 ns	15 ns	2.75 MHz
200 ns	40 ns	20 ns	1.0 MHz

BOTH THE 5 MHz F464A AND THE 4 MHz F464 WILL WORK FOR ALL THE CASES ABOVE WITH THE ONLY EXCEPTION BEING THE F464 IN THE CASE OF THE 100 ns DELAY LINE.

Fairchild cannot assume responsibility for use of any circuitry described other than circuitry entirely embodied in a Fairchild product. No other circuit patent licenses are implied.

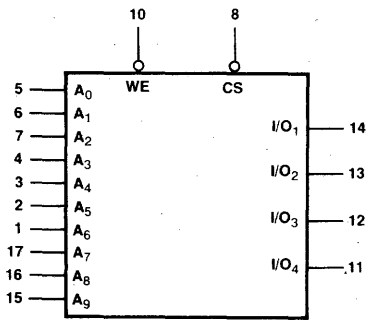
F2114

1024 x 4-BIT STATIC RANDOM ACCESS MEMORY

FAIRCHILD ISOPLANAR SILICON GATE MOS INTEGRATED CIRCUIT

GENERAL DESCRIPTION – The Fairchild F2114 is a 4096-bit static Random Access Memory organized as 1024 words by four bits each. Since the operation of the F2114 is entirely static, there is no clocking or refreshing required. It operates from a single +5 V supply and is directly TTL compatible at all inputs and outputs including the four bi-directional data I/O pins.

It is designed for memory applications in which static operation, large bit capacity, and simple interfacing are important design considerations.



The F2114 is manufactured using Fairchild's n-channel silicon gate Isoplanar process. The innovative use of polysilicon resistors in the static memory cell design permit a high bit packing density and insures low-power characteristics. It is available in standard 18-pin dual in-line packages in either plastic or ceramic.

- **1024 X 4 BIT ORGANIZATION**
- **STANDARD 18-PIN DIP PACKAGE**
- **SINGLE +5 V SUPPLY**
- **COMPLETELY STATIC – NO CLOCKS OR REFRESH**
- **TOTALLY TTL COMPATIBLE**
- **COMMON DATA I/O PINS WITH 3-STATE CAPABILITY**
- **IDENTICAL CYCLE AND ACCESS TIMES**
- **SIMPLE BUS INTERFACING USING CHIP SELECT AND WRITE ENABLE**

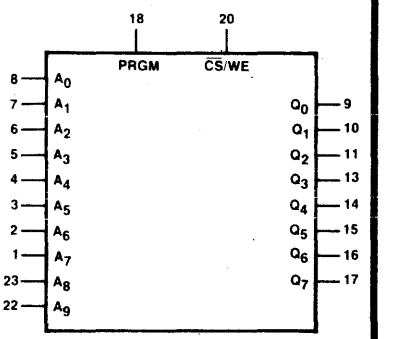
F2708

1024 x 8 UV ERASABLE PROM

FAIRCHILD ISOPLANAR SILICON GATE NMOS

GENERAL DESCRIPTION — The Fairchild F2708 is an 8,192-bit ultraviolet light erasable and electrically reprogrammable Read Only Memory manufactured using the Isoplanar n-channel silicon gate technology. Organized 1024 x 8, the F2708 is ideally suited for non-volatile data storage in applications such as 8-bit microprocessor systems, where reprogrammability, high bit density, maximum performance, and simple interfacing are essential parameters. All inputs and outputs are TTL compatible. The 3-state outputs become high impedance when the F2708 is deselected, allowing a direct interface capability which is useful in many computer bus structures.



The F2708, which is pin-for-pin compatible with industry-standard 8K-bit ROMs, provides inexpensive, non-volatile storage of data/program code in applications where fast turn-around and data/program code experimentation are important requirements. Thus, the F2708 provides the system development vehicle whereby system prototypes using the F2708 may be released into volume production by directly substituting ROM devices for F2708 devices.

- **1024 x 8 BITS ORGANIZATION**
- **FAST ACCESS TIME: 350 nx MAX (F2708-1)**
- **TTL COMPATIBLE ON INPUTS AND OUTPUTS**
- **3-STATE OUTPUTS FOR OR-TIE CAPABILITY**
- **STANDARD POWER SUPPLIES +12V, +5V, −5V**
- **CHIP SELECT INPUT FOR MEMORY EXPANSION**
- **STATIC OPERATION**
- **PIN COMPATIBLE TO 8K AND 16K ROMs FOR LOW COST PRODUCTION**
- **LOW POWER DURING PROGRAMMING**
- **CONTENTS ERASABLE WITH ULTRAVIOLET LIGHT**

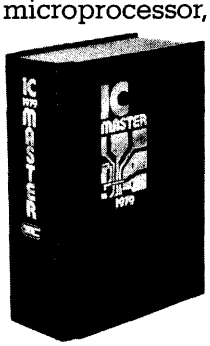
MEMORY

©IC MASTER 1979

"I need to know if this device exists, and if there are any alternate sources. Where do I start?"

- Memory IC
- RAM
- Static
- 1024x1
- CMOS
- 250 Nanoseconds
- 5 Volts

If you're spending hours to solve a problem similar to the one above, you're behind the times...



It only takes a few seconds with "THE MASTER."

Clear your desk for action with the newly revised 1979 IC Master. Its all-under-one-cover features include: Over 40,000 standard products from more than 87 different companies . . . five different selection guides (memory, microprocessor, interface, linear and digital.) . . . alternate source directory for pin- for- pin, function- for- function replacements . . . applications directory . . . complete military section . . . a complete part numbering guide . . . etc.

You don't have to search through stacks of catalogs. Simply look up the specs and function you need. You don't need a part number to start with.

All you need is a problem to use The Master. Does the device exist? Who makes it? Is there an alternate source? What's the part number? Is there an applications note? Who is my closest distributor—etc.

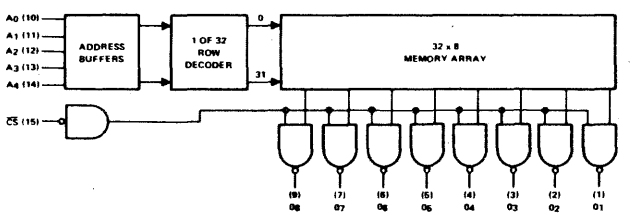
*OC Open Collector
*TS *Three State*
*APU Active Pull-Up

Description

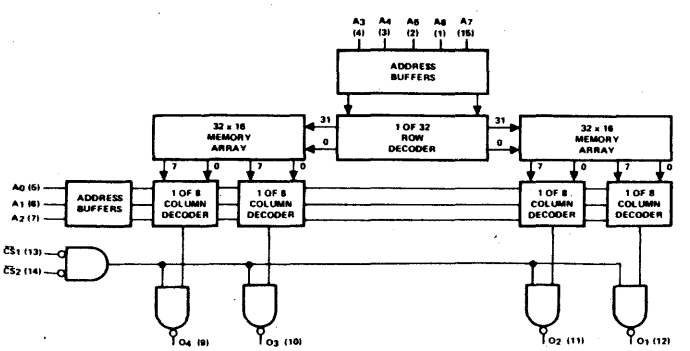
The HM-76XX Generic PROMs comprise a completely compatible family having common D.C. electrical characteristics and identical programming requirements. They are fully decoded, high speed, field programmable ROMs and are available in all commonly used organizations, with both open-collector and "Three State" outputs. All bits are manufactured storing a logical "1" (outputs high), and can be selectively programmed for a logical "0" (outputs low).

The nichrome fuse technology is the same as is used in the JAN approved MIL-STD-38510/201 PROM and in all other Harris PROMs.



The field programmable PROM can be custom programmed to any pattern using a simple programming procedure. Schottky Bipolar circuitry provides fast access time, and features temperature and voltage compensation to minimize access time variation.

All pinouts are compatible to industry standard PROMs and ROMs.



In addition to the conventional storage array, extra test rows and columns are included to assure high programmability, and guarantee parametric and A.C. performance. Fuses in these test rows and columns are blown prior to shipment.

HM-76LS03

32 x 8 PROM
"Three State" Outputs

Preliminary

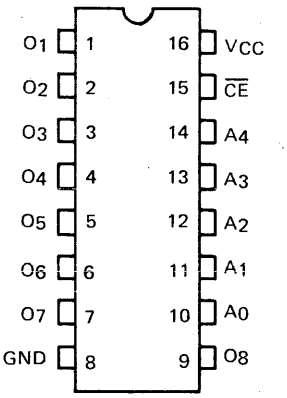
Features

- ULTRA LOW POWER - 60mW TYPICAL
- SIMPLE HIGH SPEED PROGRAMMING PROCEDURE - ONE PULSE/BIT TYPICAL, ASSURES FAST PROGRAMMING AND SUPERIOR RELIABILITY.
- INDUSTRY'S HIGHEST PROGRAMMING YIELD.
- PIN COMPATIBLE WITH THE STANDARD 7603 PINOUT.

Description

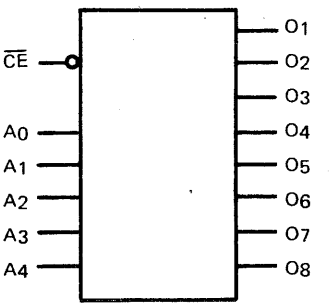
The HM-76LS03 is an ultra low power version of the standard 7603 PROM, designed to be MOS compatible with it's low ICC specification. The HM-76LS03 is a fully decoded high speed Schottky TTL 256-Bit Field Programmable ROM in a 32 word by 8 bit/word format with "Three State" outputs. This PROM is available in a 16 pin DIP (ceramic or epoxy).

All bits are manufactured storing a logical "1" (positive logic) and can be selectively programmed for a logical "0" in any bit position.



Nichrome fuse technology is used on this and all other Harris Bipolar PROMs.

The HM-76LS03 contains test rows and columns which are in addition to the storage array to assure high programmability and guarantee parametric and A.C. performance. The fuses in these test rows and columns are blown prior to shipment.



There is a Chip Enable on the HM-76LS03, $\overline{CE}$ low enables the device.

HM-7608

1K x 8 PROM

Preliminary

Features

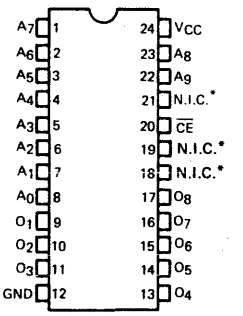
- 60ns MAXIMUM ADDRESS ACCESS TIME
- "THREE STATE" OUTPUTS WITH A CHIP ENABLE INPUT
- SIMPLE, HIGH SPEED PROGRAMMING PROCEDURE – ONE PULSE/BIT. ASSURES FAST PROGRAMMING AND SUPERIOR RELIABILITY.
- FAST ACCESS TIME – GUARANTEED FOR WORST CASE N^2 SEQUENCING OVER COMMERCIAL AND MILITARY TEMPERATURE AND VOLTAGE RANGES.
- INDUSTRY'S HIGHEST PROGRAMMING YIELD
- PIN COMPATIBLE WITH THE 2708 WITH:
  - ONLY ONE 5 VOLT SUPPLY
  - SUPERIOR ACCESS TIME
  - FASTER PROGRAMMING TIME

Description

The HM-7608 is a fully decoded high speed Schottky TTL 8192-Bit Field Programmable ROM in a 1K word by 8 bit/word format and is available in a 24 pin D.I.P. (ceramic or epoxy) and a 24 pin flat pack.

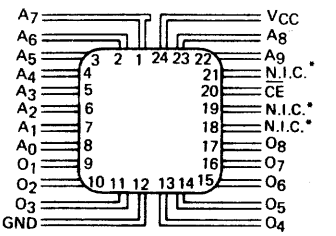
All bits are manufactured storing a logical "1" (Positive Logic) and can be selectively programmed for a logical "0" in any bit position, the HM-7608 has "Three State" outputs.

Nichrome fuse technology is used on this and all other Harris Bipolar PROM's.



The HM-7608 contains test rows and columns which are in addition to the storage array to assure high programmability and guarantee parametric and A.C. performance. The fuses in these test rows and columns are blown prior to shipment.

This PROM is a plug in replacement for the 2708 where the V_{SS} pin on the 2708 becomes GND on the HM-7608. The V_{BB}, VDD, and program pins on the 2708 are all N.C. on the HM-7608.



There is a chip enable input on the HM-7608 where $\overline{CE}$ low enables the device.

HM-7610A/11A

256 x 4 PROM

HM-7610A - Open Collector Outputs
HM-7611A - "Three State" Outputs

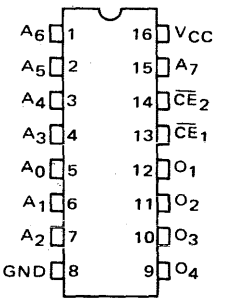
Features

- 40ns MAXIMUM ADDRESS ACCESS TIME
- "THREE STATE" OR OPEN COLLECTOR OUTPUTS
- SIMPLE, HIGH SPEED PROGRAMMING PROCEDURE USING SINGLE PULSES, ASSURES FAST PROGRAMMING AND SUPERIOR RELIABILITY
- INPUTS AND OUTPUTS TTL COMPATIBLE
- FAST ACCESS TIME – GUARANTEED FOR WORST CAST N^2 SEQUENCING OVER COMMERCIAL AND MILITARY TEMPERATURE AND VOLTAGE RANGES.
- INDUSTRY'S HIGHEST PROGRAMMING YIELD
- PIN COMPATIBLE WITH INDUSTRY STANDARD PROM's AND ROM's

Description

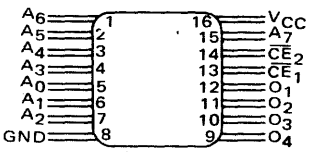
The HM-7610A/11A are fully decoded high speed Schottky TTL 1024-Bit Field Programmable ROMs in a 256 word by 4 bit/word format with open collector (HM-7610A) or "three state" (HM-7611A) outputs. These PROMs are available in 16 pin D.I.P. (ceramic or epoxy) and a 16 pin flatpack.

All bits are manufactured storing a logical "1" (positive logic) and can be selectively programmed for a logical "0" in any bit position.



The HM-7610A/11A contain test rows and columns which are in addition to the storage array to assure high programmability and guarantee parametric and A.C. performance. The fuses in these test rows and columns are blown prior to shipment.

This PROM is intended for use in state of the art ultra high speed logic systems.



Nichrome fuse technology is used on these and all other Harris Bipolar PROM's.

HM-7616
2K x 8 PROM

Preview

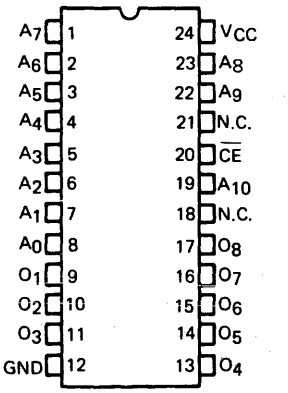
Features

- 60ns MAXIMUM ADDRESS ACCESS TIME
- "THREE STATE" OUTPUTS AND A CHIP ENABLE INPUT
- SIMPLE HIGH SPEED PROGRAMMING PROCEDURE – ONE PULSE/BIT TYPICAL
- FAST ACCESS TIME – GUARANTEED FOR WORST CASE N^2 SEQUENCING OVER COMMERCIAL AND MILITARY TEMPERATURE AND VOLTAGE RANGES
- INDUSTRY'S HIGHEST PROGRAMMING YIELD
- PIN COMPATIBLE WITH THE 2716

Description

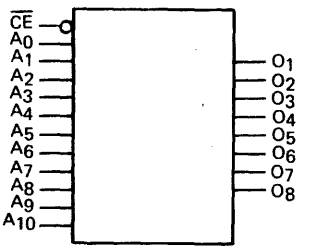
HM-7616 is a fully decoded high speed Schottky TTL, 16,384 bit Field Programmable ROM in a 2K word by 8 bit/word format with "Three State" outputs. This PROM is available in a 24 pin DIP.

All bits are manufactured storing a logical "1" (Positive Logic) and can be selectively programmed for a logical "0" in any bit position.



The nichrome fuse technology used is the same as all other Harris Bipolar PROMs and the JAN approved MIL-M-38510/201 PROM.

The HM-7616 contains test rows and columns which are in addition to the storage array to assure high programmability and guarantee parametrics and A.C. performance. The fuses in these test rows and columns are blown prior to shipment.



There is a chip enable input on the HM-7616. $\overline{CE}$ low enables the device.

HM-7629

256 x 8 PROM

"Three State" Outputs

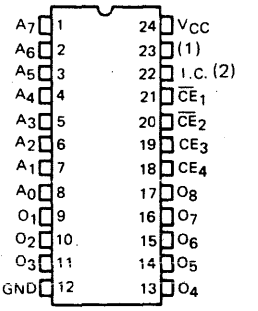
Features

- 70ns MAXIMUM ADDRESS ACCESS TIME.
- "THREE STATE" OUTPUTS WITH FOUR CHIP ENABLE INPUTS.
- SIMPLE HIGH SPEED PROGRAMMING PROCEDURE - ONE PULSE/BIT TYPICAL. ASSURES FAST PROGRAMMING AND SUPERIOR RELIABILITY.
- FAST ACCESS TIME - GUARANTEED FOR WORST CASE N^2 SEQUENCING OVER COMMERCIAL AND MILITARY TEMPERATURE AND VOLTAGE RANGES.
- INDUSTRY'S HIGHEST PROGRAMMING YIELD.

Description

The HM-7629 is a fully decoded high speed Schottky TTL 2048-Bit Field Programmable ROM in a 256 word by 8 bit/word format and is available in a 24 pin DIP (ceramic or epoxy).

All bits are manufactured storing a logical "1" (positive logic) and can be selectively programmed for a logical "0" in any bit position.



Nichrome fuse technology is used on this and all other Harris Bipolar PROMs.

The HM-7629 contains test rows and columns which are in addition to the storage array to assure high programmability and guarantee parametric and A.C. performance. The fuses in these test rows and columns are blown prior to shipment.

There are four chip enables on the HM-7629. $\overline{CE}_1$ low, $\overline{CE}_2$ low, CE_3 high , and CE_4 high enables the chip.

HM-7640AR/41AR

512 x 8 PROM

HM-7640AR - Open Collector Outputs
HM-7641AR - "Three State" Outputs

Preview

Features

- 50ns MAXIMUM ADDRESS ACCESS TIME.
- "THREE STATE" OR OPEN COLLECTOR OUTPUTS WITH THREE CHIP ENABLE INPUTS.
- SIMPLE HIGH SPEED PROGRAMMING PROCEDURE - ONE PULSE/BIT. ASSURES FAST PROGRAMMING AND SUPERIOR RELIABILITY.
- FAST ACCESS TIME - GUARANTEED FOR WORST CASE N^2 SEQUENCING OVER COMMERCIAL AND MILITARY TEMPERATURE AND VOLTAGE RANGES.
- INDUSTRY'S HIGHEST PROGRAMMING YIELD.
- LATCHED OUTPUTS.
- LOW INPUT LOADING.

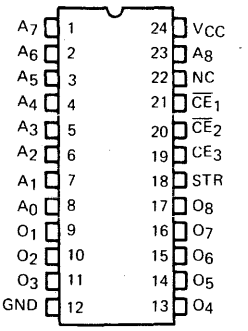
Description

The HM-7640AR/41AR are fully decoded high speed Schottky TTL 4096 Bit Field Programmable ROMs in a 512 word by 8 bit/word format and are available in a 24-pin DIP (ceramic or epoxy) and a 24-pin flat pack.

All bits are manufactured storing a logical "1" (positive logic) and can be selectively programmed for a logical "0" in any bit position.

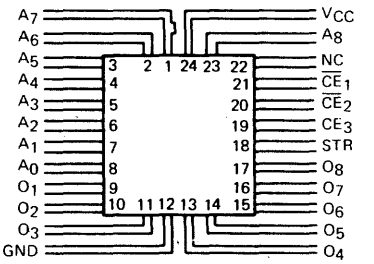
Nichrome fuse technology is used on this and all other Harris Bipolar PROMs.

The HM-7640AR/41AR contain test rows and columns which are in addition to the storage array to assure high programmability and guarantee parametrics and A.C. performance. The fuses in these test rows and columns are blown prior to shipment.



There are three chip enable inputs on the HM-7640AR/41AR, $\overline{CE}_1$, $\overline{CE}_2$ low and CE_3 high enables the chip.

HM-7640AR/41AR are operated in the Transparent Read Mode by holding the strobe input high throughout the read operation. This is the normal read mode where the three chip enable inputs will control the outputs.



In Latched Read Mode, bringing the strobe input low will latch the outputs and chip enable inputs. If the device is disabled, when the strobe input goes low the outputs will be latched in the high impedance state. If the device is in the latched mode the strobe input must be brought high to allow the outputs to respond to new address or chip enable conditions.

HM-7642P/43P

1K x 4 PROM

HM-7642P - Open Collector Outputs
HM-7643P - "Three State" Outputs

Preview

Features

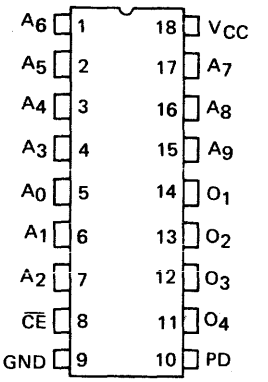
- 50ns MAXIMUM ADDRESS ACCESS TIME.
- "THREE STATE" OR OPEN COLLECTOR OUTPUTS, A POWER DOWN INPUT, AND A CHIP ENABLE INPUT.
- SIMPLE HIGH SPEED PROGRAMMING PROCEDURE - ONE PULSE/BIT. ASSURES FAST PROGRAMMING AND SUPERIOR RELIABILITY.
- FAST ACCESS TIME FOR WORST CASE N^2 SEQUENCING OVER COMMERCIAL AND MILITARY TEMPERATURE AND VOLTAGE RANGES.
- INDUSTRY'S HIGHEST PROGRAMMING YIELD.

Description

The HM-7642P/43P are fully decoded high speed SchottkyTTL 4096-Bit Field Programmable ROMs in a 1K words by 4 bit/word format with open collector (HM-7642P) or "Three State" (HM-7643P) outputs. These PROMs are available in an 18-pin DIP (ceramic or epoxy) and an 18-pin flat pack.

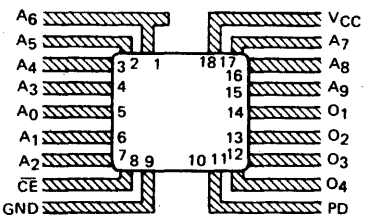
All bits are manufactured storing a logical "1" (positive logic) and can be selectively programmed for a logical "0" in any bit position.

Nichrome fuse technology is used on these and all other Harris Bipolar PROMs.



The HM-7642P/43P contains test rows and columns which are in addition to the storage array to assure high programmability and guarantee parametrics and A.C. performance. The fuses in these test rows and columns are blown prior to shipment.

There is a power down input on the HM-7642P/43P which is similar to a chip enable. The chip can be enabled or disabled using the power down input where a powered down chip dissipates 25% of nominal power and the outputs go to a high impedance state. The chip is powered up when PD_1 is low.



There is also the conventional chip enable input on this device, $\overline{CE}$ low and PD_1 low enables the device.

HM-7644A

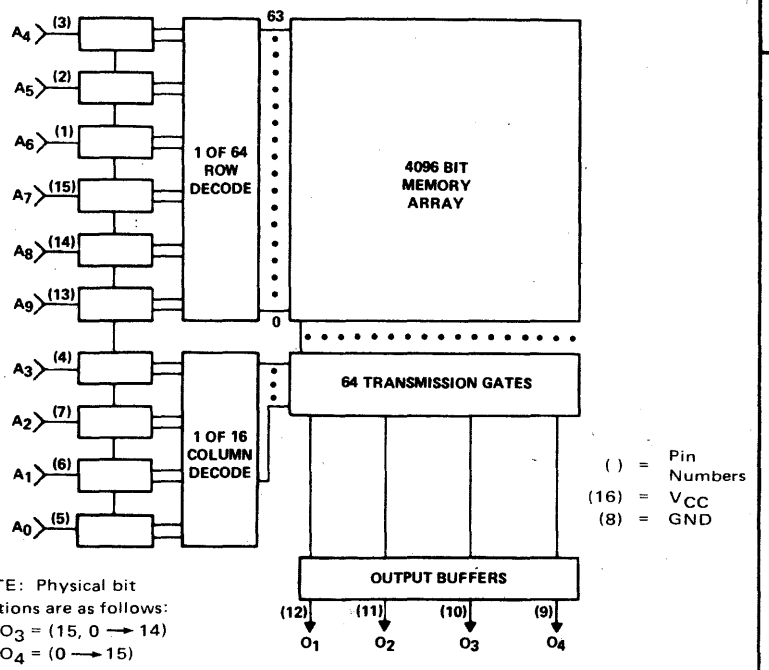
1K x 4 PROM

Active Pull-up Outputs

Features

- 50ns MAXIMUM ADDRESS ACCESS TIME
- ACTIVE PULL-UP OUTPUTS
- SIMPLE HIGH SPEED PROGRAMMING PROCEDURE ONE PULSE/BIT ASSURES FAST PROGRAMMING AND SUPERIOR RELIABILITY
- FAST ACCESS TIME - GUARANTEED FOR WORST CASE N^2 SEQUENCING OVER COMMERCIAL AND MILITARY TEMPERATURE AND VOLTAGE RANGES
- INDUSTRY'S HIGHEST PROGRAMMING YIELD
- LOW PIN COUNT FOR MAXIMUM DENSITY

Description



The HM-7644A is a fully decoded high speed Schottky TTL 4096-Bit Field Programmable ROM in a 1K word by 4 bit/word format with active pull-up outputs. This PROM is available in a 16 pin DIP (ceramic or epoxy) and a 16 pin flatpack.

All bits are manufactured storing a logical "1" (positive logic) and can be selectively programmed for a logical "0" in any bit position.

Nichrome fuse technology is used on this and all other Harris Bipolar PROMs.

The HM-7644A contains test rows and columns which are in addition to the storage array to assure high programmability and guarantee parametrics and A.C. performance. The fuses in these test rows and columns are blown prior to shipment.

"Three State" Outputs

Preview

Features

- 50ns MAXIMUM ADDRESS ACCESS TIME
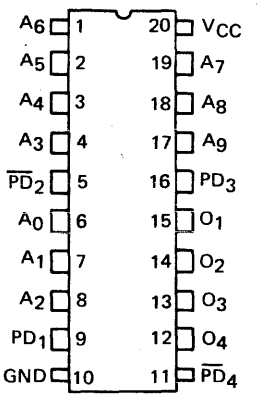
- "THREE STATE" OUTPUTS AND FOUR POWER DOWN INPUTS
- SIMPLE HIGH SPEED PROGRAMMING PROCEDURE - ONE PULSE/BIT ASSURES FAST PROGRAMMING AND SUPERIOR RELIABILITY
- FAST ACCESS TIME - FOR WORST CASE N^2 SEQUENCING OVER COMMERCIAL AND MILITARY TEMPERATURE AND VOLTAGE RANGES
- INDUSTRY'S HIGHEST PROGRAMMING YIELD
- 2142 PINOUT

Description

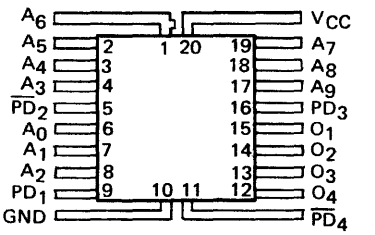
The HM-7645P is a fully decoded high speed Schottky TTL 4096-Bit Field Programmable ROM in a 1K by 4 bit/word format with "Three State" outputs. This PROM is available in a 20 pin DIP (ceramic or epoxy) and a 20 pin flatpack.

All bits are manufactured storing a logical "1" (positive logic) and can be selectively programmed for a logical "0" in any bit position.



Nichrome fuse technology is used on these and all other Harris Bipolar PROM's.

The HM-7645P contains test rows and columns which are in addition to the storage array to assure high programmability and guarantee parametrics and A.C. performance. The fuses in these test rows and columns are blown prior to shipment.



There are four power down inputs on the HM-7645P which are similar to chip enables. The chip is enabled or disabled using the power down inputs where a disabled chip dissipates 30% of nominal power and the outputs go to a high impedance state. The chip is powered up (enabled) when PD_1, PD_3 are low, and $\overline{PD}_2$, $\overline{PD}_4$ are high.

HM-7647R

512 x 8 PROM

Features

- 60ns MAXIMUM ADDRESS ACCESS TIME
- "THREE STATE" OUTPUTS WITH TWO CHIP ENABLE INPUTS
- SIMPLE HIGH SPEED PROGRAMMING PROCEDURE – ONE PULSE/BIT. ASSURES FAST PROGRAMMING AND SUPERIOR RELIABILITY.
- FAST ACCESS TIME – GUARANTEED FOR WORST CASE N^2 SEQUENCING OVER COMMERCIAL AND MILITARY TEMPERATURE AND VOLTAGE RANGES.
- INDUSTRY'S HIGHEST PROGRAMMING YIELD
- PIN COMPATIBLE WITH THE 82S115
- LATCHED OUTPUTS
- INPUT LOADING IS – 100 μA MAXIMUM

Description

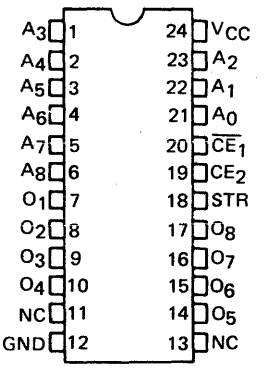
The HM-7647R is a fully decoded high speed Schottlky TTL 4096-Bit Field Programmable ROM in a 512 word by 8 bit/word format and is available in a 24 pin D.I.P. (ceramic or epoxy) and a 24 pin flatpack.

All bits are manufactured storing a logical "1" (positive logic) and can be selectively programmed for a logical "0" in any position. The HM-7647R has "Three State" outputs.

Nichrome fuse technology is used on this and all other Harris Bipolar PROMs.

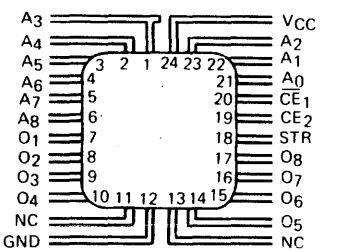
The pinout is identical to the 82S115 PROM.

The HM-7647R contains test rows and columns which are in addition to the storage array to assure high programmability and guarantee parametric and A.C. performance. The fuses in these test rows and columns are blown prior to shipment.



There are two chip enable inputs on the HM-7647R. $\overline{CE}_1$ low and CE_2 high enables the chip.

HM-7647R is operated in the Transparent Read Mode by holding the strobe input high throughout the read operation. This is the normal read mode where the two chip enable inputs will control the outputs.



In Latched Read Mode, bringing the strobe input low will latch the outputs and chip enable inputs. If the device is disabled when the strobe input goes low the outputs will be latched in the high impedance state. If the device is in the latched mode the strobe input must be brought high to allow the outputs to respond to new address or chip enable conditions.

HM-7680/81

1K x 8 PROM

HM-7680 - Open Collector Outputs
HM-7681 - "Three State" Outputs

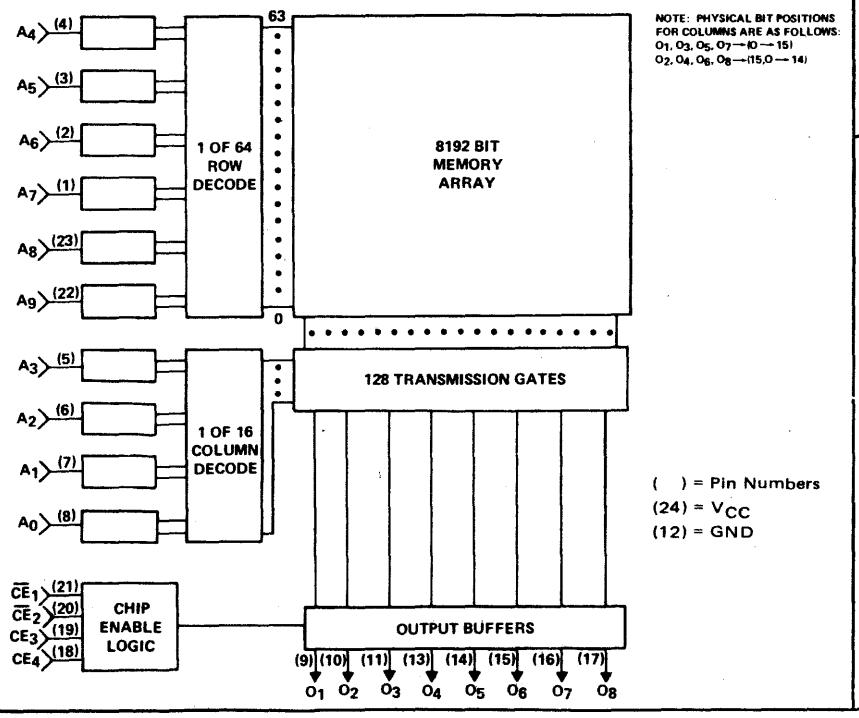
Preliminary

Features

- 60ns MAXIMUM ADDRESS ACCESS TIME
- "THREE STATE" OR OPEN COLLECTOR OUTPUTS AND FOUR CHIP ENABLE INPUTS
- SIMPLE HIGH SPEED PROGRAMMING PROCEDURE ONE PULSE/BIT. ASSURES FAST PROGRAMMING AND SUPERIOR RELIABILITY.
- FAST ACCESS TIME – GUARANTEED FOR WORST CASE N^2 SEQUENCING OVER COMMERCIAL AND MILITARY TEMPERATURE AND VOLTAGE RANGES.
- INDUSTRY'S HIGHEST PROGRAMMING YIELD

Description

The HM-7680/81 is a fully decoded high speed Schottky TTL 8192/Bit Field Programmable ROM in a 1K word by 8 bit/word format with open collector (HM-7680) or "Three State" (HM-7681) outputs. These PROM's are available in a 24 pin D.I.P. (ceramic or epoxy) and a 24 pin flat pack.



All bits are manufactured storing a logical "1" (Positive Logic) and can be selectively programmed for a logical "0" in any one bit position.

Nichrome fuse technology is used on this and all other Harris Bipolar PROMs.

The HM-7680/81 contains test rows and columns which are in addition to the storage array to assure high programmability and guarantee parametric and A.C. performance. The fuses in these test rows and columns are blown prior to shipment.

There are four chip enable inputs on the HM-7680/81. $\overline{CE}_1$, $\overline{CE}_2$ low, and CE_3, CE_4 high enables the chip.

HM-7680R/81R

1K x 8 PROM

HM-7680R - Open Collector Outputs
HM-7681R - "Three State" Outputs

Preliminary

Features

- 60ns MAXIMUM ADDRESS ACCESS TIME
- "THREE STATE" OR OPEN COLLECTOR OUTPUTS AND THREE CHIP ENABLE INPUTS
- SIMPLE HIGH SPEED PROGRAMMING PROCEDURE - ONE PULSE/BIT ASSURES FAST PROGRAMMING AND SUPERIOR RELIABILITY
- FAST ACCESS TIME - GUARANTEED FOR WORST CASE N^2 SEQUENCING OVER COMMERCIAL AND MILITARY TEMPERATURES AND VOLTAGE RANGES
- INDUSTRY'S HIGHEST PROGRAMMING YIELD
- LATCHED OUTPUTS

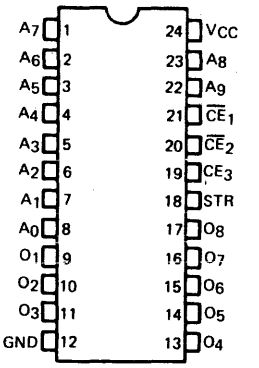
Description

The HM-7680R/81R is a fully decoded high speed Schottky TTL 8192-Bit Field Programmable ROM in a 1K word by 8 bit/word format with open collector (HM-7680R) or "Three State" (HM-7681R) outputs. These PROMs are available in a 24 pin D.I.P. (ceramic or epoxy) and a 24 pin flatpack.

All bits are manufactured storing a logical "1" (positive logic) and can be selectively programmed for a logical "0" in any bit position.

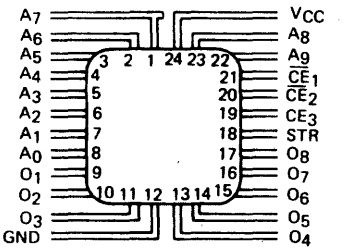
Nichrome fuse technology is used on these and all other Harris Bipolar PROMs.

The HM-7680R/81R contains test rows and columns which are in addition to the storage array to assure high programmability and guarantee parametric and A.C. performance. The fuses in these test rows and columns are blown prior to shipment.



There are three chip enable inputs on the HM-7680R/81R. $\overline{CE}_1$, $\overline{CE}_2$ low and CE_3 high enables the chip.

The HM-7680R/81R is operated in the Transparent Read Mode by holding the strobe input high throughout the read operation. This is the normal read mode where the three chip enable inputs will control the outputs.



In Latched Read Mode, bringing the strobe input low will latch the outputs and chip enable inputs. If the device is disabled when the strobe input goes low, the outputs will be latched in the high impedance state. If the device is in the latched mode the strobe input must be brought high to allow the outputs to respond to new address or chip enable conditions.

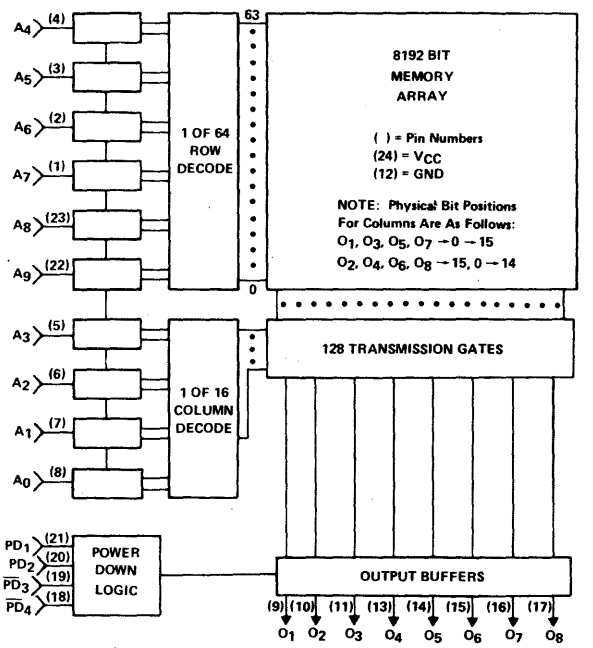
Description

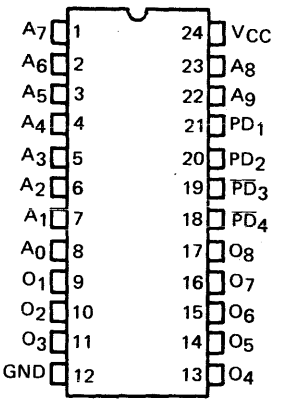
The HM-7680P/81P is a fully decoded high speed Schottky TTL 8192-Bit Field Programmable ROM in a 1K word by 8 bit/word format with open collector (HM-7680P) or "three state" (HM-7681P) outputs. These PROM's are available in a 24 pin D.I.P. (ceramic or epoxy) and a 24 pin flatpack.



All bits are manufactured storing a logical "1" (positive logic) and can be selectively programmed for a logical "0" in any bit position.

Nichrome fuse technology is used on these and all other Harris Bipolar PROM's.

The HM-7680P/81P contains test rows and columns which are in addition to the storage array to assure high programmability and guarantee parametric and A.C. performance. The fuses in these test rows and columns are blown prior to shipment.



There are four power down inputs on the HM-7680P/81P which are similar to chip enables. The chip is enabled or disabled using the power down inputs where a disabled chip dissipates 30% of nominal power and the outputs go to a high impedance state. The chip is powered up (enabled) when PD_1 and PD_2 are low and $\overline{PD}_3$ and $\overline{PD}_4$ are high.

HM-7680RP - Open Collector Outputs
HM-7681RP - "Three State" Outputs

Preview

Features

- 60ns MAXIMUM ADDRESS ACCESS TIME.
- "THREE STATE" OR OPEN COLLECTOR OUTPUTS AND TWO CHIP ENABLE INPUTS.
- SIMPLE HIGH SPEED PROGRAMMING PROCEDURE - ONE PULSE/BIT. ASSURES FAST PROGRAMMING AND SUPERIOR RELIABILITY.
- FAST ACCESS TIME - GUARANTEED FOR WORST CASE N^2 SEQUENCING OVER COMMERCIAL AND MILITARY TEMPERATURE AND VOLTAGE RANGES.
- INDUSTRY'S HIGHEST PROGRAMMING YIELD.
- LATCHED OUTPUTS.
- A POWER DOWN INPUT ALLOWING 70% REDUCTION IN NOMINAL POWER DISSIPATION.

Description

The HM-7680RP/81RP are fully decoded high speed Schottky TTL 8192-Bit Field Programmable ROMs in a 1K words by 8 bit/word format with open collector (HM-7680RP) or "Three State" (HM-7681RP) outputs. These PROMs are available in a 24 pin DIP (ceramic or epoxy) and a 24 pin flatpack.

All bits are manufactured storing a logical "1" (positive logic) and can be selectively programmed for a logical "0" in any bit position.

Nichrome fuse technology is used on these and all other Harris Bipolar PROMs.

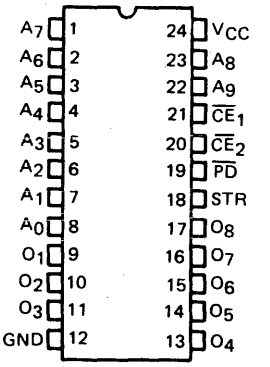
The HM-7680RP/81RP contains test rows and columns which are in addition to the storage array to assure high programmability and guarantee parametrics and A.C. performance. The fuses in these test rows and columns are blown prior to shipment.

There are two chip enable inputs on the HM-7680RP/81RP. $\overline{CE}_1$ and $\overline{CE}_2$ low enables the device.

There is also a power down input on this device. A powered down device has 70% reduction in nominal power dissipation if the outputs are not latched and 50% reduction in nominal power if the outputs are latched.

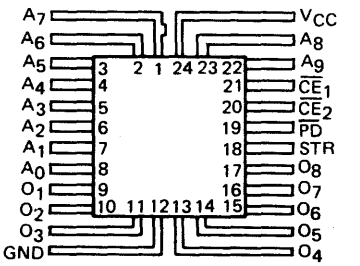
The HM-7680RP/81RP is operated in the Transparent Read Mode by holding the the strobe input high and the $\overline{PD}$ input high throughout the read operation. This is the normal read mode where the two chip enables and the power down inputs will control the outputs.

In Latched Read Mode, bringing the strobe input low will latch the outputs and the chip enable inputs. However, the power down input is independent of the latch function and can be changed while in the latched mode. If the device is disabled when the strobe input goes low, the outputs will be latched in the high impedance state. If the device is in the latched mode, the strobe input must be brought high to allow the outputs to respond to new address or chip enable conditions.



The following is a summary of the functional dependencies of the operating modes:

1. Chip enabled, transparent, powered up - normal mode where the power down input is effectively a chip enable with the I_{CC} reduction function.
2. Chip enabled, latched, power up - this is normal latched mode where the outputs remain latched regardless of address and chip enable switching.
3. Chip enabled, latched, power down - this is the powered down latched mode where the output data remains latched while power is reduced to 50% of its nominal value. If the latch strobe changes state while in this mode, the outputs will go to a high impedance state and power will reduce to 30% of nominal power. This is because the $\overline{PD}$ input becomes an effective chip enable in the Transparent Mode.
4. Chip disabled, transparent, power down - this is the normal powered down mode where the outputs are in a high impedance state and the power is reduced to 30% of the nominal power.



On the following page is a table to clarify the operational interdependencies.

HM-7683

1K x 8 PROM

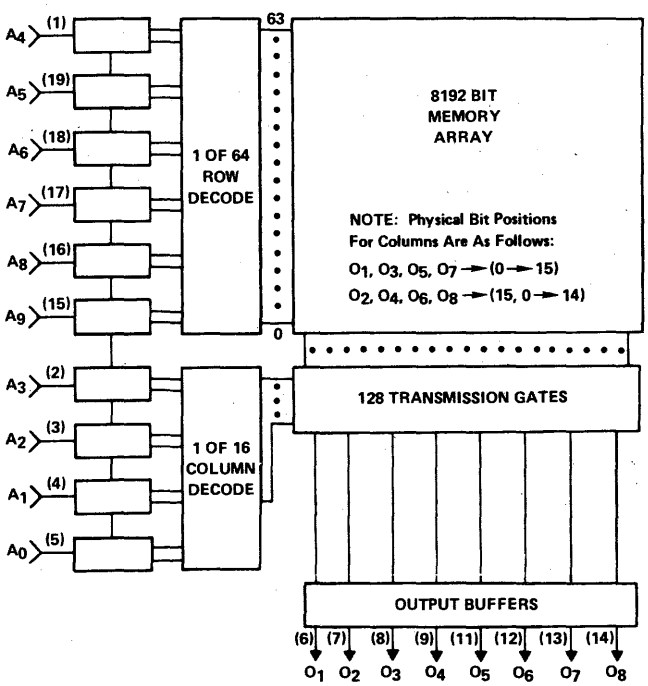
Active Pull-up Outputs

Preliminary

Features

- 60ns MAXIMUM ADDRESS ACCESS TIME
- SIMPLE, HIGH SPEED PROGRAMMING PROCEDURE - ONE PULSE/BIT ASSURES FAST PROGRAMMING AND SUPERIOR RELIABILITY.
- FAST ACCESS TIME - GUARANTEED FOR WORST CASE N^2 SEQUENCING OVER COMMERCIAL AND MILITARY TEMPERATURE AND VOLTAGE RANGES.
- INDUSTRY'S HIGHEST PROGRAMMING YIELD
- LOW PIN COUNT FOR MAXIMUM DENSITY

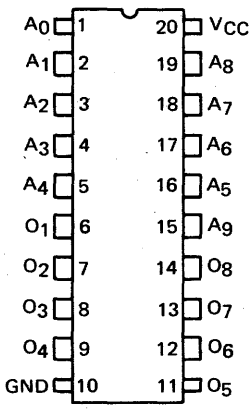
Description



The HM-7683 is a fully decoded high speed Schottky TTL 8192-Bit Field Programmable ROM in a 1K word by 8 bit/word format and is available in a 20 pin DIP (ceramic or epoxy) and a 20 pin flatpack.

All bits are manufactured storing a logical "1" (positive logic) and can be selectively programmed for a logical "0" in any bit position.

Nichrome fuse technology is used on this and all other Harris Bipolar PROMs.



The HM-7683 contains test rows and columns which are in addition to the storage array to assure high programmability and guarantee parameterics and A.C. performance. The fuses in these test rows and columns are blown prior to shipment.

HM-7684P - Open Collector Outputs
HM-7685P - "Three State" Outputs

Preview

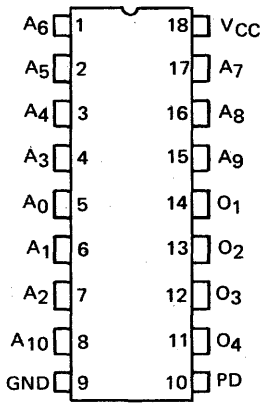
Features

- 60ns MAXIMUM ADDRESS ACCESS TIME
- "THREE STATE" OR OPEN COLLECTOR OUTPUTS AND A POWER DOWN INPUT
- SIMPLE HIGH SPEED PROGRAMMING PROCEDURE - ONE PULSE/BIT ASSURES FAST PROGRAMMING AND SUPERIOR RELIABILITY
- FAST ACCESS TIME - GUARANTEED FOR WORST CASE N^2 SEQUENCING OVER COMMERCIAL AND MILITARY TEMP. AND VOLT. RANGES
- INDUSTRY'S HIGHEST PROGRAMMING YIELD

Description

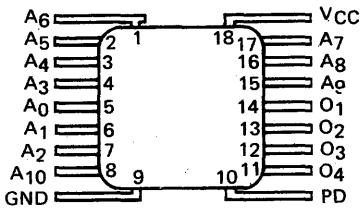
The HM-7684P/85P are fully decoded high speed Schottky TTL 8192-Bit Field Programmable ROMs in a 2K words by 4 bit/word format with open collector (HM-7684P) or "Three State" (HM-7685P) outputs. These PROMs are available in an 18 pin DIP (ceramic or epoxy) and an 18 pin flatpack.

All bits are manufactured storing a logical "1" (positive logic) and can be selectively programmed for a logical "0" in any bit position.



Nichrome fuse technology is used on these and all other Harris Bipolar PROMs.

The HM-7684P/85P contains test rows and columns which are in addition to the storage array to assure high programmability and guarantee parametrics and A.C. performance. The fuses in these test rows and columns are blown prior to shipment.



There is a power down input on the HM-7684P/85P which is similar to a chip enable. The chip is enabled or disabled using the power down input where a disabled chip dissipates 30% of nominal power and the outputs go to a high impedance state. The chip is powered up (enabled) when PD_1 is low.

HM-7686R/87R

2K x 4 PROM

HM-7686R - Open Collector Outputs
HM-7687R - "Three State" Outputs

Features

- 60ns MAXIMUM ADDRESS ACCESS TIME
- "THREE STATE" OR OPEN COLLECTOR OUTPUTS AND TWO CHIP ENABLE INPUTS
- SIMPLE HIGH SPEED PROGRAMMING PROCEDURE - ONE PULSE/BIT ASSURES FAST PROGRAMMING AND SUPERIOR RELIABILITY
- FAST ACCESS TIME - GUARANTEED FOR WORST CASE N^2 SEQUENCING OVER COMMERCIAL AND MILITARY TEMPERATURE AND VOLTAGE RANGES
- INDUSTRY'S HIGHEST PROGRAMMING YIELD
- LATCHED OUTPUTS

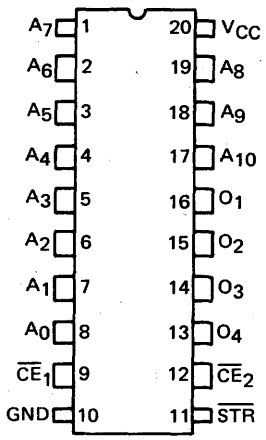
Description

The HM-7686R/87R are fully decoded high speed Schottky TTL 8192-Bit Field Programmable ROMs in a 2K words by 4 bit/word format with open collector (HM-7686R) or "Three State" (HM-7687R) outputs. These PROMs are available in a 20 pin DIP (ceramic or epoxy) and 20 pin flatpack.

All bits are manufactured storing a logical "1" (positive logic) and can be selectively programmed for a logical "0" in any bit position.

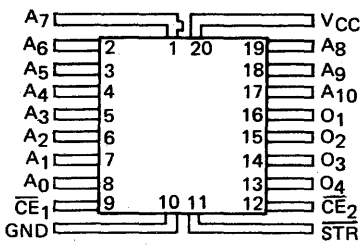
Nichrome fuse technology is used on these and all other Harris Bipolar PROMs.

The HM-7686R/87R contains test rows and columns which are in addition to the storage array to assure high programmability and guarantee parametrics and A.C. performance. The fuses in these test rows and columns are blown prior to shipment.



There are two chip enable inputs on the HM-7686R/87R. $\overline{CE}_1$, $\overline{CE}_2$ low enables the chip.

The HM-7686R/87R is operated in the Transparent Read Mode by holding the strobe input low throughout the read operation. This is the normal read mode where the two chip enable inputs will control the outputs.



In Latched Read Mode, bringing the strobe input high will latch the outputs and chip enable inputs. If the device is disabled when the strobe input goes high, the outputs will be latched in the high impedance state. If the device is in the latched mode, the strobe input must be brought low to allow the outputs to respond to new address or chip enable conditions.

HM-7686P/87P

2K x 4 PROM

HM-7686P - Open Collector Outputs
HM-7687P - "Three State" Outputs

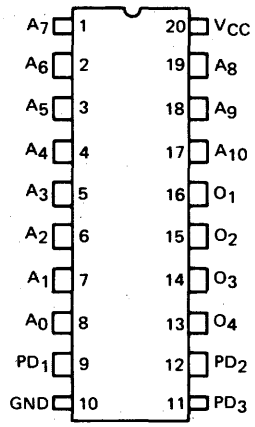
Features

- 60ns MAXIMUM ADDRESS ACCESS TIME.
- "THREE STATE" OR OPEN COLLECTOR OUTPUTS AND THREE POWER DOWN INPUTS.
- SIMPLE HIGH SPEED PROGRAMMING PROCEDURE - ONE PULSE/BIT. ASSURES FAST PROGRAMMING AND SUPERIOR RELIABILITY.
- FAST ACCESS TIME - FOR WORST CASE N^2 SEQUENCING OVER COMMERCIAL AND MILITARY TEMPERATURE AND VOLTAGE RANGES.
- INDUSTRY'S HIGHEST PROGRAMMING YIELD.

Description

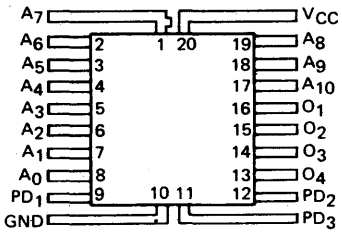
The HM-7686P/87P are fully decoded high speed Schottky TTL 8192-Bit Field Programmable ROMs in a 2K word by 4 bit/word format with open collector (HM-7686P) or "Three State" (HM-7687P) outputs. These PROMs are available in a 20 pin DIP (ceramic or epoxy) and a 20 pin flatpack.

All bits are manufactured storing a logical "1" (positive logic) and can be selectively programmed for a logical "0" in any bit position.



Nichrome fuse technology is used on these and all other Harris Bipolar PROMs.

The HM-7686P/87P contains test rows and columns which are in addition to the storage array to assure high programmability and guarantee parametrics and A.C. performance. The fuses in these test rows and columns are blown prior to shipment.



There are three power down inputs on the HM-7686P/87P which are similar to chip enables. The chip is enabled or disabled using the power down inputs where a disabled chip dissipates 30% of nominal power and the outputs go to a high impedance state. The chip is powered up (enabled) when PD_1, PD_2 and PD_3 are low.

HM-7686RP/87RP

2K x 4 PROM

HM-7686RP - Open Collector Outputs
HM-7687RP - "Three State" Outputs

Features

- 60ns MAXIMUM ADDRESS ACCESS TIME.
- "THREE STATE" OR OPEN COLLECTOR OUTPUTS AND A CHIP ENABLE INPUT.
- SIMPLE HIGH SPEED PROGRAMMING PROCEDURE - ONE PULSE/BIT. ASSURES FAST PROGRAMMING AND SUPERIOR RELIABILITY.
- FAST ACCESS TIME - GUARANTEED FOR WORST CASE N^2 SEQUENCING OVER COMMERCIAL AND MILITARY TEMPERATURE AND VOLTAGE RANGES.
- INDUSTRY'S HIGHEST PROGRAMMING YIELD.
- LATCHED OUTPUTS.
- A POWER DOWN INPUT ALLOWING 70% REDUCTION IN NOMINAL POWER DISSIPATION.

Description

The HM-7686RP/87RP are fully decoded high speed Schottky TTL 8192-Bit Field Programmable ROMs in a 2K words by 4 bit/word format with open collector (HM-7686RP) or "Three State" (HM-7687RP) outputs. These PROMs are available in a 20 pin DIP (ceramic or epoxy) and a 20 pin flatpack.

All bits are manufactured storing a logical "1" (positive logic) and can be selectively programmed for a logical "0" in any bit position.

Nichrome fuse technology is used on these and all other Harris Bipolar PROMs.

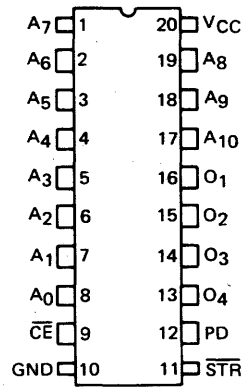
The HM-7686RP/87RP contains test rows and columns which are in addition to the storage array to assure high programmability and guarantee parametrics and A.C. performance. The fuses in these test rows and columns are blown prior to shipment.

There is a chip enable input on the HM-7686RP/87RP. $\overline{CE}$ low enables the device.

There is also a power down input on this device. A powered down device has 70% reduction in nominal power dissipation if the outputs are not latched and 50% reduction in nominal power if the outputs are latched.

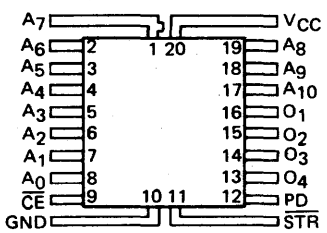
The HM-7686RP/87RP is operated in the Transparent Read Mode by holding the the strobe input low and the PD input low throughout the read operation. This is the normal read mode where the chip enable and the power down input will control the outputs.

In Latched Read Mode, bringing the strobe input high will latch the outputs and the chip enable input. However, the power down input is independent of the latch function and can be changed while in the latched mode. If the device is disabled when the strobe input goes high, the outputs will be latched in the high impedance state. If the device is in the latched mode, the strobe input must be brought low to allow the outputs to respond to new address or chip enable conditions.



The following is a summary of the functional dependencies of the operating modes:

1. Chip enabled, transparent, powered up - normal mode where the power down input is effectively a chip enable with the I_{CC} reduction function.
2. Chip enabled, latched, power up - this is normal latched mode where the output remains latched regardless of address and chip enable switching.
3. Chip enabled, latched, power down - this is the powered down latched mode where the output data remains latched while power is reduced to 50% of its nominal value. If the latch strobe changes state while in this mode, the outputs will go to a high impedance state and power will reduce to 30% of nominal power. This is because the PD input becomes an effective chip enable in the Transparent Mode.
4. Chip disabled, transparent, power down - this is the normal powered down mode where the outputs are in a high impedance state and the power is reduced to 30% of the nominal power.



On the following page is a table to clarify the operational interdependencies.

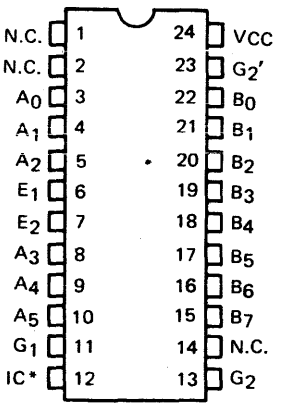
JAN-0512

512 BIT, BIPOLAR PROM
MIL/M38510/20101

Features



- FIELD PROGRAMMABLE
- 64 WORDS/8 BITS PER WORD
- FULLY DECODED
- DTL/TTL COMPATIBLE
- 55ns ACCESS TIME

Description

The JAN-0512 is a field programmable 64 word by 8 bit PROM. In an unprogrammed memory, all "Memory Elements" are short circuits so that logical "zeros" appear at each output bit position for any address input. "Electronic Programming" involves the alteration of specific "Memory Elements" to create logical "ones" in selected bit positions. This alteration is irreversible and cannot be accomplished under normal operating conditions.

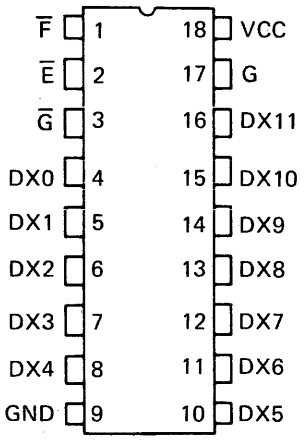
HM-6312/6312A

CMOS ROM
1024 Word x 12 Bit

Features

- HM-6100 COMPATIBLE
- LOW POWER - TYPICAL < 5.0μW STANDBY
- 4 - 11 VOLT VCC OPERATION
- HIGH SPEED
- STATIC OPERATION

Description



The HM-6312 and HM-6312A are high speed, low power, silicon gate CMOS static ROM's, organized 1024 words by 12 bits. In all static states these units exhibit the microwatt power requirements typical of CMOS. The basic part operates at 4 - 7 volts with a typical 5 volt 25°C access time of 350ns. Higher operating voltages, 4 - 11 volts, are available with the A version. Signal polarities and functions are specified for interfacing with the HM-6100 Microprocessor.

Operation

Addresses and data out are multiplexed on 12 lines, DX0 - DX11. Addresses are loading into an on chip register by falling edge of CE. Data out, corresponding to the latched address, is enabled when CE, OEL and OEH are true. The RSEL output defines an area in the 4096 word addressing space dedicated to RAM. It can be programmed by DX0, DX1, DX2 and DX3. This output eliminates a four bit register and decoder for the high order address bits to select RAM.
